OF

METEOROLOGICAL TABLES,

WITH

OTHER TABLES USEFUL IN PRACTICAL METEOROLOGY.

PREPARED BY ORDER OF THE SMITHSONIAN INSTITUTION

BY

ARNOLD GUYOT.

WASHINGTON:

PUBLISHED BY THE SMITHSONIAN INSTITUTION.

1852.

CAMBRIDGE:
STEREOTYPED BY METCALF AND COMPANY,
PRINTERS TO THE UNIVERSITY.

51.5

TO PROF. JOSEPH HENRY,

Secretary of the Smithsonian Institution.

SIR, —

IN compliance with your instructions, I have prepared the collection of Meteorological Tables contained in the following pages. I have endeavored to render it useful, not only to the observers engaged in the system of Meteorological Observations now in operation under the direction of the Smithsonian Institution, for whom it was immediately designed, but also to any Meteorologist who may desire to compare and to work out portions of the vast amount of Meteorological Observations already accumulated in the stores of science.

The reduction of the observations and the extensive comparisons, without which Meteorology can do but little, require an amount of mechanical labor which renders it impossible for most observers to deduce for themselves the results of their own observations. The difficulty is still further increased by the diversity of the thermometrical and barometrical scales which Meteorologists, faithful to old habits rather than to science and to reason, choose to retain, notwithstanding the additional labor they thus gratuitously assume to themselves. To relieve the Meteorologist of a great portion of this labor, by means of tables sufficiently extensive to render calculations and even interpolations unnecessary, is to save his time and his forces in favor of science itself, and thus materially contribute to its advancement. But most of the tables useful in Meteorology being scattered through many volumes, which are often not of easy access, this collection will be, it is hoped, acceptable to the friends of Meteorology, and will supply a want very much felt in this department of the physical sciences.

In the selection of the matter, I have been guided by the idea that the tables which I sought for my own use might also be those most likely to be wanted by others. But I wish the following to be considered as a first collection, containing only the tables most appropriate to the present purpose. They are, therefore, arranged in different and independent series, with distinct paging, but constituting together a frame-work into which any tables may be readily inserted when wanted, either to make the collection more complete, or to present a choice of tables calculated from somewhat different elements, or adapted to various methods of calculation.

The measurement of heights by means of the barometer being intimately connected with Meteorology, it was thought not inappropriate to admit into this collection Hypsometrical Tables, destined to render this kind of calculations more easy and more rapid, and thus to increase the taste for a method so useful in physical geography. I have preferred the tables of Delcros, as uniting in the greatest degree simplicity and accuracy. Those of Gauss, Bessel, and Baily may be given afterwards.

Every table contains directions for its use, when necessary; moreover, the indication of the elements used in its calculation, and of the source from which it has been taken. When no remark is made as to this last point, the table has been expressly calculated for this volume; in this case it is marked with an asterisk (*) in the general table of contents.

Very respectfully,

Your obedient servant,

A. GUYOT.

CAMBRIDGE, MASS., *December 15th*, 1851.

C O N T E N T S.

THE collection of Meteorological Tables is composed of six different series of tables, each series with a distinct paging running through the whole set, and to be found at the bottom of the pages. The figures at the head of the pages indicate the folios of each table for itself. In the following table of contents, the figures in each series refer to the folio at the bottom of the page.

I.

THERMOMETRICAL TABLES.

Comparison of the Thermometrical Scales.

TABLE I.	Comparison of Fahrenheit's Scale with the Centigrade and Reaumur's, full degrees, from $+212^{\circ}$ to -39° ,	5
" II.	Comparison of the Centigrade Scale with Reaumur's and Fahrenheit's, full degrees, from $+100^{\circ}$ to $+50^{\circ}$,	7
" III.	Comparison of Reaumur's Scale with Fahrenheit's and the Centigrade, full degrees, from $+80^{\circ}$ to $+40^{\circ}$,	7
" IV.*	Conversion of Degrees of Fahrenheit into Centigrade Degrees, for every tenth of a degree, from $+122^{\circ}$ to -76° F.,	8
" V.*	Conversion of Degrees of Fahrenheit into Degrees of Reaumur, for every tenth of a degree, from $+122^{\circ}$ to -38° F.,	13
" VI.*	Conversion of Centigrade Degrees into Degrees of Fahrenheit, for every tenth of a degree, from $+50^{\circ}$ to -54° , and from $+100^{\circ}$ to $+89^{\circ}$ C.,	17
" VII.	Conversion of Centigrade Degrees into Degrees of Reaumur, for every tenth of a degree, from $+40^{\circ}$ to -40° C.,	20
" VIII.*	Conversion of Degrees of Reaumur into Degrees of Fahrenheit, for every tenth of a degree, from $+40^{\circ}$ to -40° R.,	21

b

TABLE IX.	Conversion of Degrees of Reaumur into Centigrade Degrees, for every tenth of a degree, from $+40^{\circ}$ to -40° R.,	23
“ X.*	Value of any Number of Degrees of Fahrenheit in Centigrade Degrees,	24
“ XI.*	Value of any Number of Degrees of Fahrenheit in Degrees of Reaumur,	24
“ XII.*	Value of any Number of Centigrade Degrees in Degrees of Reaumur,	24
“ XIII.*	Value of any Number of Centigrade Degrees in Degrees of Fahrenheit,	25
“ XIV.*	Value of any Number of Degrees of Reaumur in Centigrade Degrees,	25
“ XV.*	Value of any Number of Degrees of Reaumur in Degrees of Fahrenheit,	25

II.

HYGROMETRICAL TABLES.

TABLE I.	Elastic Forces of Aqueous Vapors, by Regnault,	6
“ II.	Elastic Forces of Aqueous Vapors, by August,	8
“ III.	Psychrometrical Tables for deducing the Force of Vapor, and the Relative Humidity from the Indications of the Psychrometer, or Wet-Bulb Hygrometer, by T. Haeghens,	13
“ IV.	For deducing the Relative Humidity expressed in Hundredths, from the Indications of Dew-Point Instruments, by T. Haeghens,	29
“ V.	For deducing the Relative Humidity expressed in Hundredths, from the Indications of Saussure's Hair-Hygrometer, by T. Haeghens,	35

APPENDIX.

Tables for Comparing the Quantities of Rain-Water.

TABLE I.*	Conversion of Centimetres into English Inches,	40
“ II.*	Conversion of Centimetres into Paris or French Inches and Lines,	40
“ III.*	Conversion of English Inches into Centimetres,	41
“ IV.*	Conversion of English Inches into Paris or French Inches and Lines,	41

TABLE V.* Conversion of Paris or French Inches and Lines into Centimetres,	42
“ VI.* Conversion of Paris or French Inches and Lines into English Inches,	43

III.

BAROMETRICAL TABLES.

Comparison of the Barometrical Scales.

TABLE I.* Comparison of English and Metrical Barometers,	7
“ II.* Comparison of Metrical and English Barometers,	13
“ III.* Comparison of Old French and English Barometers,	21
“ IV.* Comparison of Old French and Metrical Barometers,	27

Reduction of the Barometrical Observations to the Freezing Point.

“ V. Reduction of English Barometers with Brass Scales,	35
“ VI. Reduction of English Barometers with Glass or Wooden Scales,	44
“ VII. Reduction of Metrical Barometers, by Delcros,	45
“ VIII. Reduction of Metrical Barometers, by Haeghens,	51
“ IX. Reduction of Old French Barometers, by Kaemtz,	85

Correction for Capillary Action.

“ X. Correction for Capillary Action in English Barometers,	90
“ XI. Normal Height of Meniscus in Millimetres, by Delcros,	90
“ XII. Correction for Capillary Action in Metrical Barometers, by Delcros,	91

IV.

HYPSONOMETRICAL TABLES.

To calculate Differences of Level by Means of Barometrical Observations.

Construction and Use of the Tables,	5
TABLE I. To deduce the Approximate Differences of Level,	12
“ II. Correction for Differences of Temperature of the Attached Thermometers,	22

TABLE III.	Correction for Decrease of Gravitation in Latitude, . . .	23
“ IV.	Correction for Decrease of Gravitation in the Vertical Line, . . .	24
“ V.	Correction for the Elevation of the Lower Station, . . .	24

To deduce Differences of Level from the Temperature of the Boiling Point of Water.

TABLE VI.	Barometric Pressures corresponding to Temperatures of Boiling Water, by Regnault,	26
“ VII.	Decimals of an Hour, to reduce, by Interpolation, the Observations to the same Time,	30
“ VIII.	Correction for Curvature and Refraction,	31

A P P E N D I X .

Comparison of the Measures of Length most generally used for indicating Heights.

TABLE I.	Relation between the Measures of Length used in different Countries,	35
“ II.*	Conversion of Metres into English Feet, giving the corresponding Value, in English Feet, of every Metre, from 1 up to 2,000,	36
“ III.*	Conversion of Metres into French Toises,	42
“ IV.*	Conversion of Metres into French Feet,	42
“ V.*	Conversion of English Feet into Metres,	43
“ VI.*	Conversion of English Feet into French Toises,	43
“ VII.*	Conversion of English Feet into French Feet,	43
“ VIII.*	Conversion of French Toises into Metres,	44
“ IX.*	Conversion of French Toises into French Feet,	44
“ X.*	Conversion of French Toises into English Feet,	44
“ XI.*	Conversion of French Feet into Metres,	45
“ XII.*	Conversion of French Feet into Toises,	45
“ XIII.*	Conversion of French Feet into English Feet,	45

V.

TABLES FOR CORRECTING THE MEANS OF METEOROLOGICAL OBSERVATIONS FOR DAILY AND YEARLY VARIATION.

DAILY VARIATION.

Corrections to be applied to the Means of the Hours of Observation, or of Sets of Hours, to obtain the true Means of the respective Days and Months.

Calculated by D. = Dove; Gl. = Glaisher; Gt. = Guyot; L. = Lefroy.

Temperature.

THERMOMETRICAL TABLES.

CONTENTS.

COMPARISON OF THE THERMOMETRICAL SCALES.

(The figures refer to the folio at the bottom of the page.)

TABLE I.	Comparison of Fahrenheit's Scale with the Centigrade and Reaumur's, full degrees, from $+212^{\circ}$ to -39° ,	5
" II.	Comparison of the Centigrade Scale with Reaumur's and Fahrenheit's, full degrees, from $+100^{\circ}$ to $+50^{\circ}$,	7
" III.	Comparison of Reaumur's Scale with Fahrenheit's and the Centigrade, full degrees, from $+80^{\circ}$ to $+40^{\circ}$,	7
" IV.	Conversion of Degrees of Fahrenheit into Centigrade Degrees, for every tenth of a degree, from $+122^{\circ}$ to -76° F.,	8
" V.	Conversion of Degrees of Fahrenheit into Degrees of Reaumur, for every tenth of a degree, from $+122^{\circ}$ to -38° F.,	13
" VI.	Conversion of Centigrade Degrees into Degrees of Fahrenheit, for every tenth of a degree, from $+50^{\circ}$ to -54° , and from $+100^{\circ}$ to $+89^{\circ}$ C.,	17
" VII.	Conversion of Centigrade Degrees into Degrees of Reaumur, for every tenth of a degree, from $+40^{\circ}$ to -40° C.,	20
" VIII.	Conversion of Degrees of Reaumur into Degrees of Fahrenheit, for every tenth of a degree, from $+40^{\circ}$ to -40° R.,	21
" IX.	Conversion of Degrees of Reaumur, into Centigrade Degrees for every tenth of a degree, from $+40^{\circ}$ to -40° R.,	23

COMPARISON OF THE THERMOMETRICAL SCALES.

THE first three tables of this set give a simultaneous comparison of the three scales mostly used at present in Meteorology, and especially of the portion of the scales not comprised in the more extensive tables which follow them. They form thus a complement to these last tables ; but as most of the temperatures contained in them do not occur in Meteorology, the comparison of the full degrees was found sufficient.

These three tables have been taken from E. L. Schubarth's Collection of Physical Tables. Berlin, 1836.

Tables IV. to IX. being more useful to the Meteorologist, the calculation has been carried out for every tenth of a degree. Tables VII. and IX. are from the *Annuaire Météorologique de France* ; the others have been calculated.

A comparison of the Centigrade and Fahrenheit degrees near the boiling point, for every tenth of a degree, for the sake of the comparison of standard thermometers, will be found at the end of Table VI.

I. COMPARISON OF FAHRENHEIT'S THERMOMETRICAL SCALE WITH THE
CENTIGRADE AND REAUMUR'S.

TABLES OF ELASTIC FORCES OF AQUEOUS VAPOR,

BY REGNAULT AND BY AUGUST.

TABLE I., from -10° to $+35^{\circ}$, is taken from V. Regnault's *Études sur l'Hygrométrie*, in the *Annales de Chimie et de Physique*, Tom. XV. For the sake of the calculation of the Psychrometrical Tables, it has been extended down to -35° , and up to $+40^{\circ}$, by means of the Table of Elastic Forces of Vapor, of the same author, to be found in the same periodical, Tom. XI. p. 333. For the fractions of degrees the mean values have been adopted.

Table II., calculated by M. August, after the experiments of Dalton, and converted into Centigrade degrees and millimetres, is given for comparison. It is taken from the French translation of Kaemtz's *Meteorology*, by Ch. Martins. The tables calculated by Kaemtz, after his own experiments, and published in the same work, give values which are generally a little lower than those of Regnault.

I. ELASTIC FORCE OF AQUEOUS VAPOR,

EXPRESSED IN MILLIMETRES OF MERCURY FOR EVERY TENTH OF A CENTIGRADE DEGREE

By REGNAULT.

III.

PSYCHROMETRICAL TABLES.

GIVING IMMEDIATELY THE FORCE OF AQUEOUS VAPOR AND THE RELATIVE HUMIDITY FROM THE INDICATIONS OF THE PSYCHROMETER.

CALCULATED BY M. T. HAEGHENS.

IN his *Etudes sur l'Hygrométrie*,* M. V. Regnault discusses the theoretical bases of the formula of the Psychrometer, given by M. August, which was,

$$x = f' - \frac{0.562(t-t')}{610-t'} h,$$

in which h represents the height of the barometer; t the temperature of the air given by the dry-bulb thermometer; t' the temperature of the wet-bulb thermometer; f' the force of aqueous vapor in the saturated air at a temperature equal to t' ; x the elastic force of aqueous vapor which exists in the air at the time of the observation.

After having modified some of the numerical values, which form the coefficients, M. Regnault adopted this formula,

$$x = f' - \frac{0.429(t-t')}{610-t'} h.$$

But comparative experiments, made by himself, showed that by substituting the coefficient 0.480 for that of 0.429, the calculated results, and those obtained by direct observation, agree perfectly in the fractions of saturation, which are greater than 0.40. This formula thus modified, or

$$x = f' - \frac{0.480(t-t')}{610-t'} h,$$

has been used for calculating the following tables. In that part of the tables which supposes the wet-bulb to be covered with a film of ice, or below the freezing point, the value $610 - t'$, which represents the latent heat of aqueous vapor, has been changed into this: $610 + 79 - t' = 689 - t'$.

The only hypothesis made, is that of a mean barometric pressure h , equal to 755 millimetres. If we take into account the causes of errors inherent to the psychrometer, and to the tables of the force of vapor, by means of which the absolute force of vapor is calculated, as well as to the differences of these tensions, taken at temperatures differing only by *one* tenth of a degree, it will be obvious that the correction due to the variations of barometric pressure can almost always be neglected. Nevertheless, a separate table has been calculated, giving the *correction* to be applied to the numbers in the Psychrometrical Tables for the heights of the barometer between 650 and 800 millimetres. It will be found at the end of the tables.

The disposition of the tables is the following:—

The temperatures are noted in centigrade degrees; the elastic force of vapor in the air, or its pressure on the barometer, is expressed in millimetres of mercury; the rel-

* *Etudes sur l'Hygrométrie*, par M. V. Regnault. *Annales de Chimie et de Physique*, 3^{me} Série, Tom. XV., 1845.

PSYCHROMETRICAL TABLES.

ative humidity is indicated in per cent. of the full saturation of the air at the corresponding temperature of the dry-bulb thermometer t .

The first vertical column contains the indications of the wet-bulb thermometer t' , beginning with the temperatures below the freezing point, when the bulb is covered with ice, from -35° , and continuing from the freezing point up to $+35^\circ$ centigrade, the bulb being simply wet.

The second column gives the differences of the force of vapor for each tenth (0.1) of a degree, between each full degree of the first column. It enables the observer to find out the correction for any fraction of a degree of the wet-bulb thermometer.

The following double columns give immediately the force of vapor and the relative humidity, corresponding to each degree of the wet-bulb, placed in the first column, on the same horizontal line, and to differences of the two thermometers, or to $t - t'$, taken at every two tenths of a degree.

The horizontal column at the bottom indicates the mean difference, for each tenth of a degree, of the force of vapor contained in the same horizontal line. It gives the correction for the intermediate differences of the thermometers; $0.1, 0.3, 0.5, 0.7, 0.9, \&c., \&c.$

To meet the wants arising from the extreme climate of North America, the tables of Mr. Haeghens have been extended from -15° to -35° centigrade, and from $+30^\circ$ to $+35^\circ$ of temperature of the wet-bulb, and to $+40^\circ$ of temperature of the dry-bulb thermometer. The forces of aqueous vapor of Regnault, as given in Table XIX., have been used for the calculations.

Use of the Tables.

Enter the tables with the difference of the two thermometers, or $t - t'$, and with the temperature of the wet-bulb thermometer t' , taking the first three pages, when the temperature of the wet-bulb is below the freezing point; and the following ones when it is above the freezing point.

Seek first the column at the head of which you find the difference of the thermometers; go down as far as the horizontal line, at the beginning of which you see the temperature of the wet-bulb thermometer; there you find the force of vapor, and the relative humidity corresponding to your observation.

Two corrections for fractions may be required for a complete calculation of the force of vapor; one for the fractions of degrees of the wet-bulb thermometer; another for the intermediate differences of the two thermometers, viz. for $0.1, 0.3, 0.5, 0.7, \&c.$

The first correction for fractions of degrees of the wet-bulb thermometer is found by multiplying the decimal fraction by the number placed in the second vertical column next to the whole degree, which number is the value of a tenth of a degree. The product must be *added* to the value of the full degree given in the table, when the temperature of the wet-bulb is above the freezing point: it must be *subtracted* when the temperature is below the freezing point, and bears the sign $-$. This correction is too important to be neglected.

The second correction, less important, for the intermediate differences of the ther-

PSYCHROMETRICAL TABLES.

mometers, which are greater by one tenth than those indicated in the tables, is given in the horizontal column at the bottom of the page. It is *constant* and always *subtractive*.

Examples of Calculation.

Difference of thermometers, or $t - t' = 0^{\circ}.8$.

Temperature of the wet-bulb thermometer, $t' = 11^{\circ}.0$.

We find, page 14, for $t - t'$, fifth double column; and for t' , first column,

The force of vapor in the air = $9^{\text{mm}}.31$.

Relative humidity, = 90.

Difference of thermometers, or $t - t' = 7^{\circ}.2$.

Wet-bulb thermometer, or t' , = $17^{\circ}.9$.

We find, page 20, for $t - t'$, = $7^{\circ}.2$, and $t' = 17^{\circ}.0$, force of vapor $10^{\text{mm}}.02$.

Additive correction for fraction $0^{\circ}.9$, or $9 \times 0.09 = 0 .81$.

Force of vapor in the air = $10 .83$.

Relative humidity, 46

Difference of thermometers, $t - t' = 6^{\circ}.5$.

Wet-bulb thermometer, $t' = 23^{\circ}.6$.

We find, page 19, for $t' = 23^{\circ}.0$, and $t - t'$, or difference, = $6^{\circ}.4$, force of vapor $16^{\text{mm}}.94$; applying immediately the correction found at the bottom of the page for one tenth more difference, or $6^{\circ}.4 + 0.1 = 6^{\circ}.5$, we have,

Force of vapor = $16^{\text{mm}}.94 - 0.06$, or $16^{\text{mm}}.88$.

Additive correction for fraction 0.6 of the wet-bulb, $6 \times 0.13 = 0 .78$.

Force of vapor in the air = $17 .66$.

Relative humidity, 56.

The wet-bulb thermometer covered with ice.

Difference of thermometers, $t - t' = 2^{\circ}.8$.

Wet-bulb thermometer (ice), $t' = -8^{\circ}.5$.

Page 18 gives for $t - t' = 2^{\circ}.8$, and $t' = -8^{\circ}.0$, force of vapor = $1^{\text{mm}}.0$.

Subtractive correction for fraction 0.5 of wet-bulb, $5 \times 0.019 = -0 .1$.

Force of vapor in the air = $0 .9$.

Relative humidity, 30.

EXAMPLE OF CALCULATION.

Wet-bulb above the Freezing Point.

$t' = 17^{\circ}.0$ $t - t' = 8^{\circ}.2$ $h = 710^{\text{mm.}}$
 The tables give for mean barometrical height 755^{mm.} Force of vapor . . . = 9.41
 Additive correction for 710^{mm.} and 8<sup>°}.2 = 0.30
 Force of vapor . . . = 9.71</sup>

The mean barometrical pressure, at a given place, being known, it is easy to make the above Psychrometrical Tables fitted for that place, by determining, by means of this last table, a constant correction, to be applied to the numbers in the tables, giving the force of vapor. This correction will be found by taking for $t - t'$, or the difference of thermometers, a mean value, the deviations of which will have little influence upon the accuracy of the results.

T A B L E

GIVING AT SIGHT THE RELATIVE HUMIDITY DEDUCED FROM THE INDICATIONS OF THE DEW POINT INSTRUMENTS.

BY M. T. HAEGHENS.

THIS table, which has been published in the *Annuaire Météorologique de France* for 1850, page 86, and following, has been calculated by Mr. Haeghens, using Regnault's Tables of Elastic Forces of Vapor. It gives directly the *relative humidity*, when the hygrometrical observations have been made by means of dew point instruments like those of Daniell, Regnault, Bache, and others.

These hygrometers are destined to find out the temperature of *the dew point*, that is the temperature to which it would be necessary to lower the temperature of the air, in order that this air be completely saturated by the aqueous vapor which it contained at the time of the observation.

The force of vapor contained in the air, or its *absolute humidity*, is thus the maximum of force of vapor which corresponds to the temperature of the dew point; it is given directly in the Table I. of the Elastic Forces of Vapor, by Regnault.

The ratio of that maximum of force of vapor at the temperature of the dew point to the force of vapor which corresponds, in the same table, to the temperature of the surrounding air at the time of the observation, is the *relative humidity*. This ratio is given in hundredths in the following table, which relieves the observer of the trouble of calculating it.

- Let t = temperature of the air surrounding the instrument.
- t' = temperature of the dew point.
- $t - t'$ = the difference between these two temperatures.

The first column, on the left, contains the temperature of the air t , in centigrade degrees. The following ones, headed with the differences, $t - t'$, between the temperatures of the air and of the dew point, give the *relative humidity* corresponding to the two elements.

	Temp. of the Air = t .	Dew point = t' .	Difference $t - t'$.	Relative Humidity.
Example:	10°.0	4°.4	5°.6	68

Should the temperature of the air t' , or the difference $t - t'$, fall between the numbers found in the columns, it is obvious, by glancing at the table, that an interpolation at sight will always be easy.

RELATIVE HUMIDITY IN HUNDREDTHS.

Temperature of the air. t =	t - t' = Difference of Temperatures of the Dew Point and of the Air.

T A B L E

FOR

DEDUCING THE RELATIVE HUMIDITY IN HUNDREDTHS, FROM THE INDICATIONS OF
SAUSSURE'S HAIR-HYGROMETER ;.

Calculated from the Experiments of Melloni.

By M. T. HAEGHENS.

THE Hair-Hygrometer of Saussure having been formerly used for long series of observations, and being still employed by some meteorologists, notwithstanding the imperfection of this instrument, on account of its giving directly the relative humidity without calculation, it was desirable to ascertain the correspondence of the degrees of this hygrometer with the relative humidity expressed in hundredths, as in the preceding table. Though these instruments compared with each other, show very often great discrepancies in their indications, yet a large number of them agree sufficiently well with the experiments of Melloni, August, and others, to allow the following table of comparison to be constructed, which table may be considered as giving good approximations. For the calculation of it, Mr. Haeghens used the results of Melloni, which agree also satisfactorily with a series of observations very carefully made by M. Delcros. See *Annuaire Météorologique de France*.

TO

THE HYGROMETRICAL TABLES.

B.

37

T A B L E S
 FOR
 COMPARING THE QUANTITIES OF RAIN-WATER.

THE three kinds of measures which are most in use for noting the quantities of rain and melted snow, are the Centimetres and Millimetres in France, the Paris or French inches and lines in Germany, and the English inches and decimals in England, America, and also in Russia, the Russian foot being the same as the English foot. The following tables will facilitate the comparison of these various measures with each other.

A glance at the tables will show that the first column on the left contains the numbers to be converted, and the heads of the following columns the fractions of these numbers, or units, each of which is one tenth of those in the first column. Shorter tables, at the bottom, give, when necessary, the value of proportional parts still smaller than those found in the larger tables.

Example.

Let 13 Centimetres be converted into French inches and lines.

Take, in Table II., the line beginning with 10 Centimetres in the first column, follow that line as far as the column headed 3 Centimetres, and there will be found the number of 4 inches 9.63 lines, which is the corresponding value in French inches of $10 \div 3$, or 13 Centimetres.

If the number is followed by a fraction, as for instance, 13.5 Centimetres, or 135 Millimetres, we find, —

	French Inches. Lines.
In the larger table 13 Centimetres =	4 .9,63
In the smaller table at the bottom 5 Millimetres =	.2,216
Or 13.5 Centimetres =	4.11,846

When the measures which are to be compared are both subdivided into decimal parts, the equivalents of the numbers greater than 9.9 may be found by moving the decimal point.

Example.

Let 346.7 Centimetres be converted into English inches.

In Table I., in the column headed 4, on the fourth line,
 we find

$$3.4 \text{ Centimetres} = 1.3386 \text{ English inches.}$$

Moving the decimal point by two places we have

$$340 \text{ Centimetres} = 133.86 \text{ English inches.}$$

Then, in the column headed 7, on the
 line beginning with 6, we find

$$6.7 \text{ Centimetres} = 2.64$$

Making together

$$346.7 \text{ Centimetres} = 136.50 \text{ English inches.}$$

COMPARISON

OF

THE BAROMETRICAL SCALES.

THE following tables are intended for converting into each other the three most important Barometrical Scales. They are sufficiently detailed to save the labor of any calculation or even of interpolation for the ordinary wants of Meterology. But before making use of them, for comparing the observations taken with barometers of different scales, it is necessary to reduce the observed heights to the temperature of the freezing point, or to any other temperature, provided it be the same for all, by means of the tables calculated for this purpose, and which will be found below. The reason of it may be readily understood.

The length of the bars of metal, or of other substances, which represent the standard measures of length which obtain among different nations, varying with the temperature, it was necessary to determine a fixed point of temperature at which they really ought to have the length adopted as the standard unit of measure. This temperature is the *normal* temperature of the standard, and the length of the standard-bar, at this temperature, is the *true* length of it.

If the normal temperature of the various standards used for dividing Barometrical Scales were the same, the heights of the barometrical column, taken with these scales, could be compared directly, provided the scales be made of the same substance, brass, for instance, because their variations above or below this normal temperature would remain parallel with each other. But unfortunately it is not so. The standard length of the English yard has been taken at 62° Fahrenheit; that of the Old French standard, at 13° Reaumur; that of the Metre at the freezing point or zero Centigrade. Thus metallic rods intended to represent these various units of measure give the true or standard length only when at these respective temperatures; at any other temperature they are longer or shorter than the standard, and their subdivisions, inches, lines, or millimeters partake of the error.

It is obvious, therefore, that the barometrical heights, taken with different scales, cannot be compared directly by means of the following tables, which give the relation between these scales at their respective *normal* temperatures. For suppose the temperature of the three barometers to be the freezing point, or 32° Fahrenheit,

the scale of the Metrical Barometer alone will actually represent the standard length, and the millimeters will have the true length; while the inches and lines of the Old French and of the English Barometers will be too short, causing thus the barometrical column to appear too high. If the temperature of the instruments be 62° Fahrenheit, the divisions of the English Barometer will have the true standard length, and those of the Old French Barometer nearly so; but the millimeters of the Metrical Barometer will be too long, causing the barometrical column to appear too low. It is to neutralize the effect of those unequalities arising from the expansion of the scale, that it is necessary before comparing the observations taken with the three barometers to reduce them to the same temperature. This is done by means of the tables above mentioned, for reducing the barometer to the freezing point, which suppose the scales to be of brass from top to bottom, and which take into account the expansion or contraction they undergo by the variations of temperature.

But in doing so, we must be aware that the accuracy of the comparison depends in part upon the correctness of the indications of the attached thermometers, which determine the amount of the correction to be applied for reducing the barometers to the freezing point. If the thermometers do not agree, an error is introduced which will affect the height of the reduced columns, and the final comparison. Therefore the correction of the attached thermometers ought to be ascertained and applied to them before the reduction is made; or if this correction is unknown, it will be well to place the instruments to be compared in the most favorable conditions for taking the same temperature, and then to take the temperature given by *one* of the thermometers to reduce both barometers. If the correction of the attached thermometer has not been applied before the reduction, it will be contained, *after* the reduction, in the total correction of the instrument. If it be so, this circumstance must be indicated.

COMPARISON
OF OLD FRENCH AND METRICAL BAROMETERS.

T A B L E

FOR

CONVERTING PARIS LINES INTO MILLIMETRES,

GIVING IMMEDIATELY IN MILLIMETRES THE VALUES CORRESPONDING TO
EVERY TENTH OF A PARIS LINE, FROM 240 LINES, OR 20 INCHES,
TO 348 LINES, OR 29 INCHES.

IV. COMPARISON OF OLD FRENCH AND METRICAL BAROMETERS.

1

RUSSIAN BAROMETER.

A REGULAR system of Meteorological Observations has been established by order of the Russian government throughout the extensive regions placed under its sway, and a vast amount of observations made in Europe, in Asia, and in North America have already been published. The scale of the barometer employed in this system is divided in units, each of which is equal to one half of a Russian, or English decimal line, that is, $1 = 0.05$ of an inch, 600 half-lines of the Russian Barometer being = 30 inches of the English Barometer.

The conversion of this scale, which is the English scale, slightly modified in its form, is easy. It suffices to divide the Russian heights by two, and to put back, by one figure, the decimal point, in order to have them converted into English inches and decimals, and by means of the English scale into any other. This transformation is so easy to effect, that a peculiar table for it would seem superfluous.

The normal temperature of the standard being the same as that of the English, that is, $13^{\circ}\frac{1}{3}$ Reaumur, or 62° Fahrenheit, the reduction of the Russian Barometer to the freezing point can be made by means of the table for reducing the English Barometers. But the attached thermometer being that of Reaumur, its indications must be first converted into degrees of Fahrenheit.

T A B L E S

FOR

REDUCING THE BAROMETRICAL OBSERVATIONS TAKEN AT ANY TEMPERATURE TO THE TEMPERATURE OF THE FREEZING POINT.

THE variations of the mercurial column in a stationary barometer are due to two causes, the changes of atmospheric pressure and the variations of temperature of the mercury, which affect the length of the column by changing its density. The variations of atmospheric pressure, which alone the barometer is destined to ascertain, are therefore hidden, and their observation falsified by the expansion or contraction of the mercury due to changes of temperature. For, supposing that, while the atmospheric pressure remains the same, the temperature of the instrument becomes lower, the mercurial column will become shorter, and the barometer will appear to fall; if the pressure becomes less, but the temperature increases, the expansion of the mercury will tend to compensate the diminution of pressure, and the barometer may remain stationary, or even may rise, while it ought to be falling; in other cases the action of temperature will tend to increase the amount of the changes of the barometrical height. It is therefore evident that successive observations, with the same barometer, do not give *directly* the actual changes of atmospheric pressure, unless they have been taken exactly at the same temperature, a case which, in practice, seldom occurs. Likewise simultaneous observations, taken with various barometers, do not give *directly* the actual differences of the absolute pressure of the atmosphere above the instruments. To obtain the true barometrical heights, that is, the action of the atmospheric pressure alone, the influence of the temperature must first be eliminated from the observed heights. This is done by reducing, by means of the following Tables, the various barometrical columns to the length they would have at a given temperature, which is the same for all. For the sake of convenient comparison, the freezing point has been almost universally adopted as the standard temperature to which all observations are to be reduced.

CONSTRUCTION OF THE TABLES.

In all the following Tables the barometers are supposed to be furnished with brass scales, extending from the surface of the mercury in the cistern to the top of the mercurial column. The correction to be applied is therefore composed of two elements: the correction for the expansion of the mercury, and that for the expansion of the scale; both of which ought to be, and have been, taken into account.

Indeed, the correction for the expansion of mercury is not sufficient to reduce the readings to the height which the barometer would indicate, under the same pressure, at the temperature of the freezing point. For when the temperature rises the mercurial column expands; but then the scale also grows longer, and this will tend to lower the reading of the height. The correction for the expansion of the mercury

TABLES FOR REDUCING BAROMETRICAL OBSERVATIONS.

must thus be diminished by the amount of that of the scale, that is, by nearly $\frac{1}{10}$, this being the proportion between the expansion of brass and that of mercury.

It is also the expansion of the scale which causes an apparent anomaly in the Tables for the Reduction of the English and Old French Barometers. It can be seen, that, though the observations are to be reduced to the freezing point, or to 32° Fahrenheit and zero Reaumur, the Tables give still a correction for observations taken at that temperature. The reason of it is, that the normal length of the English and Old French standards has not been determined at the temperature of the freezing point, as is the case with the metre, but respectively at the temperatures of 62° Fahrenheit and 13° Reaumur. It is thus *only at these temperatures* that the scales graduated with these standards have their true length. Above and below, the inches of the scales are longer or shorter than the inches of the standards. At the freezing point, therefore, the correction for the expansion of the mercury is null, but that for the expansion of the scale is not. The scale being too short, the reading will be too high, and a *subtractive* correction must still be applied, which will be gradually compensated at lower temperatures by the now *additive* correction of the mercurial column. Thus the point of no correction will occur at 28°.5 Fahrenheit, instead of 32°, in the English Barometer, and at -1°.5 Reaumur, instead of zero, in the Old French.

Schumacher has calculated and published in his *Collection of Tables, &c.*, and in his *Jahrbuch* for 1836, 1837, and 1838, extensive tables for the reduction of the English, Old French, and Metrical Barometers, using the following general formula:—

Let h = observed height.

“ t = temperature of the attached thermometer.

“ T = temperature to which the observed height is to be reduced.

“ m = expansion, in volume, of mercury.

“ l = linear expansion of brass.

“ s = normal temperature of the standard scale.

The reduction to the freezing point will be given by the formula, —

$$h \cdot \frac{m(t-T) - l(t-s)}{1 + m(t-T)}$$

The following tables, which may be found more convenient for ordinary use, have been calculated after the same formula. Table V., published in the Instructions of the Royal Society of London, is mostly abstracted from the table of Schumacher. It gives the reduction of the English Barometer, adopting the following values:—

Let h = observed height in English inches.

“ t = temperature of attached thermometer in degrees of Fahrenheit.

“ m = expansion, in volume, of mercury for one degree Fahrenheit = 0.0001001.

“ l = linear expansion of brass for one degree Fahrenheit = 0.0000104344.

The normal temperature of standard being = 62°.

The reduction to 32° Fahrenheit will be given then by the formula, —

$$h \cdot \frac{m(t-32) - l(t-62)}{1 + m(t-32)}$$

The values for Tables VII., VIII., and IX. are to be found at the head of each.

V.

ENGLISH BAROMETER.

T A B L E

FOR

GIVING THE CORRECTION TO BE APPLIED TO ENGLISH
BAROMETERS,

WITH BRASS SCALES EXTENDING FROM THE CISTERN TO THE TOP OF
THE MERCURIAL COLUMN, FOR REDUCING THE OBSERVATIONS
TO THIRTY-TWO DEGREES FAHRENHEIT.

TABLE V.

THE following Table, calculated after that of Schumacher, has been adopted by the Committee of Physics and Meteorology of the Royal Society of London. It gives immediately the correction for every degree of Fahrenheit, and for every half-inch from 20 up to 31 inches. The scale of the barometer is supposed to be of brass, extending from the cistern to the top of the mercurial column. The difference of expansion of brass and mercury is taken into account. The standard temperature of the yard being 62° Fahr., and not 32° Fahr., the difference of expansion of the scale and of the mercurial column carries the point of no correction down to 29° Fahr. Therefore, from 29° up the correction must be *subtracted* from, from 29° down it must be *added* to, the observed height.

Examples of Calculation.

Barometer, observed height, 30.231
Attached thermometer 82° Fahr.

See in the last page the column of 30 inches; go down as far as the horizontal line corresponding with 82° in the first vertical column, which contains the temperatures; you will find there the correction —.143. We have thus:—

Barometer, observed height, 30.231
Subtractive correction for 82° Fahr., —0.143

Barometer at 32° Fahr., 30.088

Barometer, observed height, 29.743
Attached thermometer 25° Fahr.

The column of 29.5 inches opposite to 25° Fahr. gives an
additive correction of, +0.009

Barometer at 32° Fahr., 29.752

It will be easy to apply also the correction for fractions of a degree Fahrenheit, for example:—

Barometer, observed height, 28.358
Attached thermometer 71.3

In the column of 28.5 inches, we find that the difference between the correction for 71° and that for 72° is .003; dividing this difference proportionally to the fraction, we have for three tenths of a degree a correction of —.001, which added to —.108, the correction for 71°, makes a total correction of, —.109

And barometer at 32° Fahr., 28.249

V. REDUCTION OF THE ENGLISH BAROMETER TO THE FREEZING POINT.

TABLE VI.

In most of the common barometers the scale is engraved upon a short plate of brass, fixed upon the wooden frame of the instrument. In such a case, the compound expansion of the two substances can only be guessed at, and the correction to be applied to the observations for reducing them to the freezing point cannot be determined with precision. As a near approximation for such imperfect instruments, the following table, taken from the Instructions of the Royal Society of London, may be used. In this table, the expansion of glass, which is less than that of brass, and greater than that of wood, has been substituted to that of brass, as an approximate value for a scale composed of these last two substances.

VI. CORRECTION TO BE APPLIED TO ENGLISH BAROMETERS, THE SCALES OF WHICH ARE ENGRAVED ON GLASS, TO REDUCE THE OBSERVATIONS TO THE FREEZING POINT.

VII.

METRICAL BAROMETER.

TABLE

FOR

REDUCING TO THE FREEZING POINT THE BAROMETRICAL
COLUMN,

MEASURED BY BRASS SCALES, EXTENDING FROM THE CISTERN TO
THE TOP; CALCULATED FROM 260 TO 865 MILLIMETRES,
AND FOR EACH DEGREE CENTIGRADE.

By M. T. DELCROS.

TABLE VII.

THIS table has been calculated by using the following coefficients of dilatation : —

Brass, linear dilatation, from Laplace and Lavoisier for 100° C. = 0.0018782.

Mercury, dilatation in volume, from Dulong and Petit for 100° C. = 0.0180180.

Dilatation of the mercurial column for 100° C. . . . = 0.0161398.

Dilatation of the mercurial column for 1° C. . . . = 0.0001614.

Observed height reduced to freezing point,

$$H = h - h (0.0001614). \quad T = h - h \left(\frac{T}{6196} \right).$$

The second term of this last formula is given by the table, when the temperature *T* and the height *h* of the barometer are known; this correction must be *subtracted* from the observed height *h*, when the temperature is above freezing point; it is to be *added* when the temperature is below zero, or freezing point.

This table allows the barometrical heights taken at the highest summits, and in the deepest mines, to be corrected.

Examples of Calculation.

Barometer, observed height,	mm. 567.49
Temperature of the barometer, +12°.7.	
Second page, { for 10.0 = 0.912	
{ for 2.0 = 0.182	
{ for 0.7 = 0.064	
Total, = 1.158	
<i>Subtractive</i> correction,	— 1.16
Barometer at zero,	566.33

Barometer, observed height,	mm. 454.17
Temperature of the barometer, —7°.8.	
First page, { for 7.0 = 0.514	
{ for 0.8 = 0.059	
Total, = 0.573	
<i>Additive</i> correction,	+0.57
Barometer at zero,	454.74

VIII.

METRICAL BAROMETER.

T A B L E

FOR

REDUCING TO THE FREEZING POINT THE BAROMETRICAL
COLUMN,

MEASURED BY BRASS SCALES, EXTENDING FROM THE CISTERN TO THE TOP; CALCULATED FOR THE HEIGHTS BETWEEN 650 AND 800 MILLIMETRES, AND FOR EVERY TENTH OF A DEGREE, FROM 0° TO $+$ AND -35° CENTIGRADE.

By M. T. HAEGHENS.

THIS table has been calculated by using the same coefficients of dilatation as in the preceding table, viz. : —

- Brass, linear dilatation, from Laplace and Lavoisier for 100° C. = 0.0018782.
- Mercury, dilatation in volume, from Dulong and Petit for 100° C. = 0.0180180.
- Dilatation of the mercurial column for 100° C. . . . = 0.0161398.
- Dilatation of the mercurial column for 1° C. . . . = 0.0001614.

This table, calculated for the reduction of long series of meteorological observations, gives immediately the value of the correction for each tenth of a degree up to 35° C. above, and down to 35° C. below, the freezing point, and for mercurial columns of from 650 to 800 millimetres.

Examples of Calculation.

Barometer, observed height, ^{mm.} 754.17
 Temperature of the attached thermometer, +17°.8.

For finding the correction, seek in the horizontal column, headed *barometer*, at the head of the pages, the corresponding height of the barometer; it will be found, p. 24, barometer 755^{mm.} (from 752.50 to 757.50); next seek in the first vertical column, containing the temperatures, 17°, follow then horizontally this line as far as the column of 8 tenths, and you find there 2.17 millimetres, which is the correction, or the quantity to be subtracted for reducing the observed height to zero. We have thus: —

Observed height,	^{mm.} 754.17
<i>Subtractive</i> correction for +17°.8 =	— 2.17
	<hr style="width: 50%; margin-left: auto; margin-right: 0;"/>
Barometer at zero,	752.00

If the temperature is below zero, the correction will be additive.

Observed height,	^{mm.} 729.72
Temperature of the attached thermometer, —8°.4.	
<i>Additive</i> correction,	+0.99
	<hr style="width: 50%; margin-left: auto; margin-right: 0;"/>
Barometer at zero,	730.71

BAROMETER : 650 ^{mm} . (from 647.51 to 652.50).

IX.

OLD FRENCH BAROMETER.

T A B L E

FOR

REDUCING TO THE FREEZING POINT THE OBSERVATIONS
TAKEN WITH OLD FRENCH BAROMETERS,

PROVIDED WITH BRASS SCALES, EXTENDING FROM THE CISTERN TO THE
TOP OF THE MERCURIAL COLUMN; CALCULATED FROM 280 TO 345
LINES, OR FROM 23 INCHES 4 LINES TO 28 INCHES 9 LINES.

By KAEMTZ.

TABLE IX. is taken from KAEMTZ'S *Lehrbuch der Meteorologie*, Vol. II. p. 236.
 The values adopted by Kaemtz for reducing the Old French Barometer are the following: —

Let h = observed height in French lines.

“ t = temperature of attached thermometer in degrees of Reaumur.

“ m = expansion of mercury between 0 and 80° Reaumur = 0.018018.

“ l = linear expansion of brass between 0 and 80° Reaumur = 0.0018782.

The normal temperature of standard being = 13° Reaumur.

And the formula becomes, —

$$h \cdot \frac{m \times t - l(t - 13)}{1 + m \times t}$$

The Table gives the corrections only for full degrees and for every fifth line; but the intermediate values can easily be found by an interpolation at sight.

Example of Reduction.

Observed height = 325.32 lines.

Attached thermometer = 12.5 Reaumur.

In the line beginning with 12°, and in the vertical column headed 325 lines, we find,

Correction for 12° = -0.89 lines.

Interpolation for 0°.5 = -0.03 “

Correction for 12°.5 = -0.92 “

And we have,

Observed height, 325.32 “

Correction for 12°.5, -0.92 “

Height at the freezing point = 324.40 lines.

T A B L E S

FOR CORRECTING THE

DEPRESSION OF THE BAROMETRICAL COLUMN DUE TO THE
CAPILLARY ACTION.

TABLE X., to be found in the Report of the Committee of Physics and Meteorology of the Royal Society of London, 1840, gives the correction to be applied to English barometers for capillary action in boiled and unboiled tubes. It takes into account the diameter of the tube, but not the variations of the height of the meniscus, or of the convexity which terminates the barometrical column. This last element is supposed to be in its *normal state* and *constant*.

Tables XI. and XII., published by Delcros, in the *Annuaire Météorologique de France*, for 1849, give the means of finding the true correction to be applied to metrical barometers for capillary action.

Table XI. shows the normal height of the meniscus when in contact with the air (as is the case in the inferior branch of a syphon barometer), and in the barometric vacuum at the top of the column, in tubes of different bores. It enables the observer to judge better of its variations.

Table XII. has been calculated by Delcros after the formulas of Schleiermacher, making the constant x equal to $6^{\text{mm}}.5278$, being the mean value between that of Gay-Lussac = $6^{\text{mm}}.5262$, and that of Schleiermacher = $6^{\text{mm}}.5295$. It gives the amount of the capillary action in millimetres of mercury, taking into account both the size of the bore, or the internal radius of the tube, which will be found in the vertical argument, and the height of the meniscus, given in the horizontal argument. The internal radius of the tube is supposed to be known; the height of the meniscus, or the vertical distance from the base, that is, from the sharp line where the mercury ceases to be in contact with the walls of the tube, to the very top of the convexity, can be ascertained by measuring it several times by means of the vernier.

Example :— Suppose the internal radius of the tube to be $3^{\text{mm}}.2$, and the height of the meniscus to be $0^{\text{mm}}.8$; seek in the first vertical column the number $3^{\text{mm}}.2$; follow then the horizontal line as far as the vertical column headed $0^{\text{mm}}.8$, we find there the number $0^{\text{mm}}.776$, which is the amount of the depression due to capillary action, or the value of the correction to be *added* to the observation.

X. TABLE FOR THE CORRECTION TO BE ADDED TO ENGLISH BAROMETERS FOR CAPILLARY ACTION.

Diameter of Tube.	Correction for	
	Unboiled Tubes.	Boiled Tubes.
Inch.	Inch.	Inch.
0.60	0.004	0.002
0.50	0.007	0.003
0.45	0.010	0.005
0.40	0.014	0.007
0.35	0.020	0.010
0.30	0.028	0.014
0.25	0.040	0.020
0.20	0.060	0.029
0.15	0.088	0.044
0.10	0.142	0.070

XI. TABLE OF THE HEIGHT OF THE MENISCUS OF THE BAROMETRICAL COLUMN.

Internal Radius of the Tube in Millimetres.	Normal Height of the Meniscus in Millimetres.	
	In the Air.	In the Vacuum.
1	0.427	0.34
2	0.795	0.64
3	1.079	0.86
4	1.287	1.08
5	1.413	1.13
6	1.488	1.19
7	1.524	1.22

VERTICAL ARGUMENT = INTERNAL RADIUS OF TUBE. HORIZONTAL ARGUMENT = HEIGHT OF MENISCUS IN MILLIMETRES.

1

XII. DEPRESSION OF THE BAROMETRICAL COLUMN DUE TO CAPILLARY ACTION.

Radius of the Tube in Millimetres.		Height of the Meniscus in Millimetres.															Radius of the Tube in Millimetres.

TABLES

FOR THE

CALCULATION OF DIFFERENCES OF LEVEL BY MEANS OF BAROMETRICAL OBSERVATIONS.

CALCULATED AFTER THE COMPLETE FORMULA OF LAPLACE,

BY M. T. DELCROS.

Construction of the Tables.

If we take z = difference of level of the two barometers,
 a = earth's mean radius = 6366200 metres,
 L = mean latitude between the two stations,

and further:—

$$\text{At Station.} \left\{ \begin{array}{l} \text{Lower.} \left\{ \begin{array}{l} h = \text{observed height of the barometer,} \\ T = \text{temperature of the barometer,} \\ t = \text{temperature of the air,} \end{array} \right. \\ \text{Upper.} \left\{ \begin{array}{l} h' = \text{observed height of the barometer,} \\ T' = \text{temperature of the barometer,} \\ t' = \text{temperature of the air,} \end{array} \right. \end{array} \right.$$

and if we make finally $H = h' + h \cdot \left(\frac{T-T'}{6196}\right)$,

we shall have, according to Laplace, the following general and complete equation:—

$$z = 18336 \text{ metres} \times \left\{ \begin{array}{l} \left(1 + \frac{2(t+t')}{1000}\right) \\ \left(1 + 0.0028371 \cos. 2. L\right) \\ \left(\left(1 + \frac{z}{a}\right) \cdot \text{Log.} \left(\frac{h}{H}\right) + \frac{z}{a} 0.868589\right) \end{array} \right\}$$

after the proper transformations this equation becomes:—

$$z = \text{Log.} \left(\frac{h}{H}\right) 18336 \text{ metres} \times \left\{ \begin{array}{l} \left(1 + \frac{2(t+t')}{1000}\right) \\ \left(1 + 0.0028371 \cos. 2. L\right) \\ \left(1 + \frac{\left(\text{log.} \left(\frac{h}{H}\right) + 0.868589\right) \cdot \frac{z}{a}}{\text{Log.} \left(\frac{h}{H}\right)}\right) \end{array} \right\}$$

D

introducing into this expression the value in metres of a , the earth's mean radius, making $z = \text{Log.} \left(\frac{h}{H} \right) 18336$ and $\text{Log.} \left(\frac{h}{H} \right) = \left(\frac{z}{18336} \right)$, which can be done without sensible error, the above formula takes the following form, sufficiently accurate for practical purposes : —

$$z = \text{Log.} \left(\frac{h}{H} \right) \cdot 18336 \text{ metres} \times \left\{ \begin{array}{l} \left(1 + \frac{0.2 (t + t')}{1000} \right) \\ \left(1 + 0.0028371 \cos. 2. L \right) \\ \left(1 + \frac{z + 15926}{6366200} \right) \end{array} \right\}$$

the four factors of which can easily be developed in tables, as has been done by Mr. Oltmanns. But though this *savant* chose to develop also the second factor, I found better not to do so, partly because the calculation of it is very easy, and also on account of the great extent it would have been necessary to give to this table, in order to avoid troublesome interpolations.

In the calculation of h' . $\left(\frac{T - T'}{6196} \right)$, Mr. Oltmanns used the constant coefficient of the absolute expansion of the mercurial column; I took that of the relative expansion of the mercury and of the brass scale. It is obvious, therefore, that if the scale of the barometer employed was of wood, glass, iron, or of another substance, it would be necessary to make use of as many different coefficients, and the Table II. could not be used. Moreover, Oltmanns combined the last two factors of the general formula in one single table with double entry. This table I have calculated, extending it sufficiently to avoid a double interpolation; but as it seemed to me much too extensive, I substituted for it Tables III. and IV., which are more condensed, without rendering any troublesome interpolation necessary.

I carried the calculation of these tables beyond the limits at which Oltmanns chose to stop, in order that they may answer for the most extreme cases.

At the head of each table will be found the factor of which it is the development; this makes any other explanation superfluous.

All these tables give, at sight, the numbers wanted; only when very great precision is desired, a slight interpolation, at sight, and very easy to apply, may be required. My principal object was to relieve the calculator of the troublesome and annoying labor of interpolations.

I added to these four tables the small Table V., taken from the *Annuaire du Bureau des Longitudes* of Paris. It will be seldom used.

When calculating the differences of level, in the same order with the tables, and with the complete formula of Laplace, we shall always arrive at results which will never differ by more than one decimetre in the most extreme cases. The following example will illustrate this statement. I take the observation made in a balloon, by Gay-Lussac, at Paris, as an extreme case, which is very well adapted to manifest the errors of the tables, if there were any, by comparing the results obtained by means of them with those of the direct calculation according to the complete formula of Laplace, from which they are derived.

*Example of Calculation by the complete Formula of Laplace and by the Tables.
Height of the Balloon of Gay-Lussac.*

The observation gave: —

Balloon h' = 328.80	$T' = - 9.5$	$t' = - 9.5$
Paris $h = 765.68$	$T = + 30.8$	$t = + 30.8$

$$T - T' = + 40.3 \quad (t + t') = + 21.3 \text{ et } 2(t + t') = 42.6$$

With these data the formula of Laplace gives the following calculation: —

Log. h' = 328.80	= 2.5169318	
Log. $(T - T')$ = + 40.3	= 1.6053050	
Log. dilat. coefficient = 0.0001614	= 6.2079035	

Corr. $a = +$	<small>Milli.</small> 2.14	log. = 0.3301403
$h' =$	328.80	

H =	330.94	log. = 2.5197480
	log. $h = 765.68$	= 2.8840473

(Log. $h - \text{Log. H}$) = Difference of Log.	= 0.3642993

-------------------------	-------

Altitude of balloon = 7035.44	by the formula of Laplace.
-------------------------------	----------------------------

D

Now let us calculate by the tables, placing side by side the corresponding results given by the formula of Laplace.

Balloon	^{Millim.} $h' = 328.80$	$T' = - 9.5$	$t' = - 9.5$	
Paris	$h = 765.68$	$T = + 30.8$	$t = + 30.8$	
	with $\left\{ \begin{array}{l} h' = 328.80 \\ h = 765.68 \end{array} \right\}$	Table I. gives $\left\{ \begin{array}{l} 1478.4 \\ 8209.8 \end{array} \right\}$		By the formula of Laplace we found :
		$A = 6731.4$		
	with $(T' - T) = - 40.3$, Table II. gives $a = - 52.0$	$(A + a) = 6679.4$	^{Metres.} 6679.79	
	with $L = 48^\circ 50'$, Table III. gives $\alpha = - 2.3$	$(A + a + \beta) = 6677.1$	6677.26	- 2.53
	with $2(t + t')$ direct calculation gives $v = + 284.5$	$(A + a + \beta + v) = 6961.6$	6961.71	+ 284.45
	with 6960, Table IV. gives $\delta = + 25.1$	$(A + a + \beta + v + \delta) = 6986.7$	6986.74	+ 25.03
	Altitude of barometer at Paris	$= + 48.7$	+ 48.70	
	Therefore altitude of balloon	$= 7035.4$	7035.44	

Two results which are sensibly identical. This ought not to astonish us; the tables being the exact development of the formula, they ought to give the same results, provided in both cases nothing has been neglected, and the four factors have been calculated in the same relative order.

DELCROS.

Disposition and Use of the Tables.

The disposition of the tables is the following :—

In Table I., the first column on the left contains the height of the barometer in millimetres, corrected for the error of the instrument.

The second column headed N (number), gives in metres the first two figures of the number corresponding to each height of the barometer in the first column; the third column, headed 0.0, gives the remaining figures for the full number of millimetres; the following columns give the remaining figures for the same number of millimetres and each decimal fraction of a millimetre which may follow it. The value of the hundredths is to be found in the last column.

Example :— Height of Barometer = 761.00.

We look out in the first column for the number 761, and we find on the same line in the second column, 81; in the third column, headed 0.0, or full number, 61.1. The corresponding number is thus 8161.1 metres.

D

6

Height of barometer = 761.35.

The second column gives 81 ; the column headed 0.3 gives, on the same line, 64.2. The corresponding number is then 8164.2. Adding the value of five hundredths of millim., being 0^m.5, as indicated in the last column, we have 8164.7 metres, corresponding to 761.35 millim.

The other four tables need no further explanation.

To calculate, by means of the tables, a difference of level from two barometrical observations, proceed in the following manner : —

1. Take the height of the barometer at the lower station, or *h*, and seek in Table I. the number corresponding to this height. Seek likewise the number corresponding to the height of the barometer at the upper station. Subtract the second from the first. The remainder is the approximate difference of level between the two stations. Then apply the following corrections.

2. Correction to be applied for the temperature of the barometers.

If *T'* be the temperature of the attached thermometer at the upper station, and *T* that of the attached thermometer at the lower station, take the difference, or *T' — T*, and seek in Table II. the number corresponding to this difference.

When *T'* is smaller than *T*, that is, when the temperature of the attached thermometer of the upper station is lower than that of the lower station, the correction is to be *subtracted* from the approximate height; when *T'* is greater than *T*, it is to be *added*.

3. Correction for the temperature of the air.

The first correction having been applied, multiply the number obtained, or *N*, by the double sum of the temperatures of the air at both stations, and divide the product by 1000 ; the number thus found, or the quantity expressed by $\frac{N}{1000} \cdot 2 (t + t')$ is the correction in metres which is to be *added* to the preceding number *N*.

4. Tables III. and IV. give two corrections ; the first due to the decrease of gravitation in latitude, which is to be *added* when the mean latitude of the places of observation is between the 45th parallel and the equator ; and to be *subtracted* when it is between the same parallel and the poles, as indicated at the head of the columns. The second correction, due to the decrease of gravitation in the vertical line, is always *additive*.

5. Table V. gives another small correction to be added in the case of the lower station being very elevated above the level of the ocean.

EXAMPLES OF CALCULATION.

Measurement of the Height of Guanazuatō. By M. de Humboldt.

Barometer at the upper station,	<i>h'</i> = 600.95	<i>T'</i> = 21.3	<i>t'</i> = 21.3
Barometer at the level of the sea,	<i>h</i> = 763.15	<i>T</i> = 25.3	<i>t</i> = 25.3
D			

Table I. gives the corresponding numbers,		$\left\{ \begin{array}{l} h = 8183.5 \\ h' = 6280.8 \end{array} \right.$
	Difference,	1902.7
Table II. gives for $T' - T$,		— 5.2
	Difference,	1897.5 = N
$\frac{N}{1000} \cdot 2 (t + t') = 1.897 \times 93.2$,		+ 176.8
	Sum,	2074.3
Table III. gives for mean latitude of 21° ,		+ 4.3
Table IV. gives for decrease of gravitation in the vertical line,		+ 6.0
Hence altitude of Guanaxuato above the ocean,		2084.6

Measurement of the height of Mont Blanc, August 29, 1844. By MM. Bravais and Martins.

Barometer at one metre below the summit, $h' = 424.05$ $T' = - 4.2$ $t' = - 7.6$
 Barometer of the Observatory of Geneva, $h = 729.65$ $T = 18.6$ $t = 19.3$

Table I. gives for numbers corresponding to		$\left\{ \begin{array}{l} h = 7826.0 \\ h' = 3504.4 \end{array} \right.$
	Difference,	4321.6
Table II. gives for $T' - T$,		— 29.3
	Difference,	4292.3 = N
$\frac{N}{1000} \cdot 2 (t + t') = 4292 \times 23.4 =$		+ 100.4
	Sum,	4392.7
Table III. gives for the mean latitude of 46° ,		— 0.4
	Difference,	4392.3
Table IV. for decrease of gravitation in the vertical line		+ 13.7
Table V. for the elevation of the lower station,		+ 0.5
	Sum,	4406.5
Elevation of the lower barometer above the ocean,		407.0
Hence elevation of upper barometer above the ocean,		4813.5
Finally, height of the summit of Mont Blanc above the ocean,		4814.5

8.0	10.3	16.0	20.6	24.0	30.9	32.0	41.3	40.0	51.6

This Table supposes the scale to be of brass from the top to the cistern. If it were of glass or of wood, the argument T' - T ought to be diminished at the ratio of 54 to 62.

In calculating the formula of Laplace, we begin by reducing the barometers to the same temperature by means of the following formula: $H = h' + h' \left(\frac{T' - T}{6196} \right)$. Table II. saves this trouble, and gives, in metres, the correction due to the difference of temperature of the barometers. The formula adopted is,

$$\text{Log. } (a + ax) = \text{Log. } a + x - \frac{1}{2} x^2 + \frac{1}{3} x^3 \dots$$

Substituting in this formula h instead of a , subtracting $\text{Log. } h$ from each number, we have,

$$\text{Log. } (h + hx) - \text{Log. } h = \text{Log. } (h) - \text{Log. } (h) - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \&c.$$

Striking $\text{Log. } (h)$ out of the second member, and the terms $\frac{1}{2} x^2 + \frac{1}{3} x^3 \dots$, which are without influence, we have $\text{Log. } (h + hx) - \text{Log. } h = x$; Replacing x by its value $= \left(\frac{T' - T}{6196} \right)$, and multiplying by M and by 6196, the general barometrical coefficient, we have finally for the value in metres of the correction due to $(T' - T)$

$$\frac{M}{6196} (T' - T) 18336 = \left(\frac{0.4312945}{6196} \right) 18336 (T' - T).$$

TABLE III. CORRECTION FOR DECREASE OF GRAVITATION IN LATITUDE.

$$\beta = (0.0028371 \cos. 2 L). (A + a + \beta).$$

The Argument is the Mean Latitude between the two Stations.

D

THERMOMETRICAL MEASUREMENTS OF HEIGHTS.

TO DEDUCE DIFFERENCES OF LEVEL FROM THE TEMPERATURE OF THE BOILING
POINT OF WATER.

WHEN water is heated in the open air, the elastic force of the vapors produced from it gradually increases, until it becomes equal to the incumbent weight of the atmosphere. Then, the pressure of the atmosphere being overcome, the steam escapes rapidly in large bubbles, and the water boils. The temperature at which, in the open air, water boils thus depends upon the weight of the atmospheric column above it, and under a less barometric pressure the water will boil at a lower temperature than under a greater pressure. Now as the weight of the atmosphere decreases with the elevation, it is obvious that in ascending a mountain the *higher* the station where an observation is taken the *lower* the temperature will be at which water boils at that station. Therefore for measuring the heights it is only necessary to find the barometric pressures which correspond to the various temperatures of boiling water.

The barometric pressure at the lower and at the upper station being known, the difference of altitude may be found by the usual formula, or by the tables for the calculation of heights from barometrical observations.

From the above it may be seen that the heights determined by means of the temperature of boiling water are less reliable than those deduced from barometrical observations. Both derive the difference of altitude from the difference of atmospheric pressure. But the temperature of boiling water gives only *indirectly* the atmospheric pressure, which is given *directly* by the barometer. This method is thus liable to all the chances of error which may affect the measurements by means of the barometer, and besides it adds to them new ones peculiar to itself, the principal of which, not to speak of the differences exhibited in the various tables of the force of vapor, is the difficulty of ascertaining with the necessary accuracy the true temperature of boiling water. In the present state of thermometry it would be hardly safe, indeed, to answer, in the most favorable circumstances, for quantities so small as hundredths of degrees, even when the thermometer has been constructed with the utmost care; moreover the quality of the glass of the instrument, the form and the substance of the vessel containing the water, the nature of the water itself, the place at which the bulb of the thermometer is placed, whether in the current of steam or in the water, all these circumstances cause no inconsiderable variations to take place in the indications of thermometers observed under the same atmospheric pressure.

Owing to these various causes, an observation of the boiling point, differing by one tenth of a degree from the true temperature, ought to be still admitted as a good one. Now, as the tables show, an error of one tenth of a degree Centigrade in the temperature of boiling water would cause an error of 2 millimetres in the barometric pressure, or of from 70 to 80 feet in the final result, while with a good barometer the error of pressure will hardly ever exceed one tenth of a millimetre, making a difference of 3 feet in altitude.

Notwithstanding these imperfections, the hypsometric thermometer, or thermometrical barometer, is of the greatest utility to travellers traversing distant or rough countries, on account of its being more conveniently transported and much less liable to accidents than the mercurial barometer. The best form for it is that contrived and described by Regnault in the *Annales de Chimie et Physique*, T. XIV. p. 202. It consists of an accurate thermometer with long degrees, subdivided into tenths, whose bulb is placed, about 2 or 3 centimetres above the surface of the water, in the steam arising from distilled water in a cylindrical vessel, the water being made to boil by a spirit lamp. The whole instrument when closed is about 6 inches long; when drawn out for observation, about 14 inches.

The following table of barometric pressures, corresponding to temperatures of boiling water, has been calculated by Regnault from his Tables of Forces of Vapor, and published in the *Annales de Physique et de Chimie*, T. XIV. p. 206. It gives, in millimetres of mercury, the barometric pressures corresponding to every hundredth of a Centigrade degree from $85^{\circ} \text{C} = 433$ millimetres to $102^{\circ} \text{C} = 790$ millimetres.

The accuracy of this table has been tested by direct observation by Mr. Wisse, a traveller competent in such matters, who noted down simultaneously the temperatures of the boiling point of water and the height of the barometer, in various parts of the Andes, up to the summit of the volcano of Pichincha, including in his observations barometrical pressures ranging from 752 to 430 millimetres of mercury. The agreement between the barometric pressures given here by Regnault and those found by Wisse are very satisfactory, the differences never exceeding a few tenths of a millimetre. See *Annales de Chimie et de Physique*, T. XXVIII. p. 123.

TABLE FOR CORRECTION OF CURVATURE AND REFRACTION.

From a mountain, when furnished with a barometer, or with an apparatus for determining the temperature of boiling water, and a pocket level, an observer can find the elevations of distant points, which are in sight, but lower than the mountain itself on which he stands. He has only to seek, with the level, the point on the slope of the mountain which corresponds to the point at a distance that he wishes to determine, and to take there a barometrical, or a boiling point observation. This observation is to be calculated in the usual way, but the result must be corrected for the curvature of the surface of the globe, and for the atmospheric refraction, by means of the following Table.

This method, which furnishes the means of multiplying, without much trouble, the measurements of heights, gives approximations which are sufficient for most of the purposes of Physical Geography. It may even seem preferable to direct measurements for determining the mean elevation of certain physical lines, which are best estimated when seen from a distance; such as the upper limit of the growth of trees, the limits of different kinds of vegetation, that of permanent snow, that of the mean elevation of the crest of a mountain range, &c.

A P P E N D I X

TO

THE HYPSONOMETRICAL TABLES.

**COMPARISON OF THE DIFFERENT MEASURES OF LENGTH MOST GENERALLY USED
FOR INDICATING ALTITUDES.**

COMPARISON

OF THE

MEASURES OF LENGTH MOST GENERALLY USED FOR INDICATING HEIGHTS.

Of the different measures of length the following most generally prevail for expressing altitudes. For the sake of their comparison, the relation between each of them, and both the English foot and metre, is given in the following table :—

I. Relation between the Measures of Length used in different Countries.*

Units	English Feet.	Metres.
English yard	= 3.	= 0.91438347
English foot	= 1.	= 0.30479449
Russian foot	= 1.	= 0.30479449
Metre	= 3.2808992	= 1.
French Toise	= 6.394590	= 1.9490366
Paris, or old French foot	= 1.065765	= 0.3248394
Rhine foot, Prussian and Danish	= 1.029722	= 0.313854
Bavarian foot	= 0.957561	= 0.291859
Klafter of Vienna = 6 Austrian feet,	= 6.222768	= 1.896654
Austrian foot, $\frac{1}{6}$ of a Klafter,	= 1.037128	= 0.316111
Vara, Spanish and Mexican, = 3 Castilian feet,	= 2.78209	= 0.847965
Castilian foot	= 0.927363	= 0.282655

By far the greater number of published altitudes being given either in Metres, French Toises, Paris Feet, or English Feet, and the best tables for calculating heights, giving the results in one or another of these measures, the following tables have been calculated to facilitate their conversion into each other.

* For reference, see J. H. Alexander's "Dictionary of Weights and Measures"; T. J. Lee, "A Collection of Tables and Formula, useful in Geology," &c.; Balbi, "Tableau comparatif des Monnaies, Poids, et Mesures," &c.

II. CONVERSION OF METRES INTO ENGLISH FEET AND DECIMALS.

1 Metre = 3.2808992 English Feet.

The following tables, being based, like the preceding ones, upon the decimal system, can be used, not only for converting the simple units and fractions of the respective measures into the others, but also any numbers, the corresponding value of which does not exceed six figures. For this it suffices to move the decimal point to the right by as many figures as you add ciphers to the numbers in the first column. Take, for instance, the table for converting English feet into metres; you find in the first column and in the second, headed 0, 5 English feet = 1.52397 metre. By adding successively one cipher to the figure 5, indicating the English feet, and moving the decimal point accordingly, in the corresponding number of metres, you will have,

5	English feet	=	1.52397	metre.
50	"	=	15.2397	"
500	"	=	152.397	"
5000	"	=	1523.97	"
50000	"	=	15239.7	"

and so on; it will be the same for each figure of the first column.

The numbers at the head of the vertical columns being tenths of those in the first column, they can be taken indiscriminately as fractions, or as units, or tens,

CONVERSION OF METRES INTO ENGLISH FEET AND DECIMALS.

or hundreds, &c. Taking, for example, 6 English feet in the first column and 5 tenths in the fifth vertical column, we find,

6.5 English feet = 1.98116 metre.
 or multiplying by ten, 65 " = 19.8116 "
 or 650 " = 198.116 "
 or 6500 " = 1981.16 "
 or 65000 " = 19811.6 "

and so on with all the other numbers of two figures and their multiples by ten.

By means of a simple addition, we obtain the conversion of numbers with four figures. Say 9843 English feet to be converted into metres.

We find 9800 English feet = 2986.99 metres.
 43 " = 13.106 "
 or 9843 " = 3000.096 "
