OF A SERIES OF

METEOROLOGICAL OBSERVATIONS,

MADE IN OBEDIENCE TO INSTRUCTIONS

FROM

THE REGENTS OF THE UNIVERSITY,

AT

SUNDRY ACADEMIES IN THE STATE OF NEW-YORK,

FROM 1826 TO 1850 INCLUSIVE.

COMPILED FROM THE ORIGINAL RETURNS, AND THE ANNUAL REPORTS OF THE REGENTS OF THE UNIVERSITY,

BY FRANKLIN B. HOUGH, A.M., M.D.,

CORRESPONDING MEMBER OF THE NEW-YORK HISTORICAL SOCIETY.

PUBLISHED BY LEGISLATIVE AUTHORITY.

AN ACT

Providing for the publication of the Results of Meteorological Observations made under the direction of the Regents of the University from the year one thousand eight hundred and twenty-five to one thousand eight hundred and fifty, inclusive.

PASSED April 15, 1854, three-fifths being present.

The People of the State of New-York, represented in Senate and Assembly, do enact as follows:

§ 1. The Regents of the University are hereby empowered to contract for the publication of the results of the Meteorological Observations, made under their direction at the several academies of the state, from the year one thousand eight hundred and twenty-five to one thousand eight hundred and fifty, inclusive, upon such terms and in such manner as they shall deem proper.

§ 2. The sum of three thousand dollars is hereby appropriated for the above purpose.

§ 3. This act shall take effect immediately.

I N T R O D U C T I O N .

THE Regents of the University of the State of New-York, who are, by law, constituted the guardians and visitors of the several academies within the State which participate in the distribution of its Literature Fund, by a resolution, passed March 1st, 1825, directed that each of the academies incorporated by their Board should be furnished with a thermometer and pluviometer, or rain gage, the expense of which should be paid out of the funds of the Regents. The Vice-Chancellor (Mr. SIMEON DE WITT), and MESSRS. GERRIT Y. LANSING and JOHN GREIG, were appointed a committee to provide these instruments, and to prescribe rules for making observations upon them, and of keeping meteorological records, of which, reports were required to be annually made to the Board. At a subsequent meeting of the Regents, it was resolved that, in addition to the requirements then existing, an exact register of observations, made with the thermometers and rain gages furnished to academies, according to the instructions that might be given by the committee appointed for that purpose, should be considered necessary to entitle academies to their dividends of the public fund.

The system of observations thus required was subsequently maintained at a considerable proportion, but not at all, of the academies of the State, from 1826 to 1850, inclusive; and from the results reported to the Regents an abstract was published in the annual reports of that body. Meanwhile, with the improvements in the construction of instruments, and new discoveries in the science of meteorology, it was felt that this system of observations scarcely kept pace with the general increase of knowledge; and accordingly the Legislature, in 1849, in compliance with the advice of the Regents, granted a sum of money for the purchase of improved meteorological instruments, with the view of the establishment of a new system of observations, in accordance with the increased demands of science. This change was made to conform with the system of meteorological observations organized under the direction of the Smithsonian Institute at Washington, which is designed to embrace as extensive a field of observation in the United States and adjacent countries as possible. To this institution the New-York observers were required to report; and from it they were expected to receive their blanks and instructions.

The former series of observations, extending throughout the State, and over the period of a quarter of a century, having thus been brought to a close, it became an interesting subject of inquiry, whether useful practical deductions, and facts tending to establish important scientific results, might not be obtained from a generalization of the data which had been recorded; and this seemed the more necessary, as the annual results, as published, were scattered through voluminous documents, some of which were difficult of access, and of which very few entire series existed together.

Although the immediate laws which govern meteorological changes can only be studied by a comparison of simultaneous observations, made at proper intervals of time and space, yet many of the laws of climate, the modifications from local causes, and useful comparisons between different seasons, can be advantageously shown from records like those which form the subject of this work. With this view, the Regents of the University were pleased to approbate a proposition made to their body by the editor of this volume, in 1850, for the collection and generalization of the series of records which had been made under their direction; and to express their belief that the results, thus afforded, would possess the highest interest to science. The American Association for the Advancement of Science, at its session in Albany, in August, 1851,

referred the subject to its meteorological committee, who, after due examination, reported a resolution commending it to the Legislature for patronage, and appointed a sub-committee, consisting of Dr. T. ROMEYN BECK, of Albany, Professor E. LOOMIS, of New-York, and Professor A. GUYOT, of Cambridge, Mass., to examine the relative merits of the several classes of records that had been made by academies, and to decide upon what portions the proposed results should be based, and what parts, if any, should be omitted as unimportant.

In the course of this investigation, it was recommended that records of parts of years should be omitted, as tending to produce unequal results; and that instead of noting the prevailing direction of the wind, by the initials of the cardinal points, the resultant of the wind should be given. The work of collection and generalization having been completed, was submitted by the Regents to the Legislature of 1854, for publication; and an act, passed in accordance with their recommendation, has enabled them to issue this volume.

With this brief history of the work, it may be proper to give a detail of the instructions that were issued to observers, with such additional directions for observations as were subsequently issued, in order that the results may be received at their just value.

The THERMOMETERS originally furnished were mostly manufactured by Mr. Kendall, of New Lebanon, but in many instances these were repeatedly replaced, when broken, by others of different makers; but in all instances, the graduation was that of Fahrenheit. Observers were directed to place this instrument "in a situation where there is a free circulation of air, and where it cannot be affected either by the direct or reflected rays of the sun, or by a radiation of heat or cold from neighboring bodies. Heat may be reflected or radiated from bare dry earth, sand, gravel or pavement; the place about it should therefore be covered with grass in its season. Heat may be reflected to some distance from walls or other structures of a light color; the thermometer should therefore be placed considerably remote from them. Massy walls slowly imbibe or part with caloric; they will therefore, after sudden changes in the weather, possess for some time a temperature different from that of the circulating air, and by radiation affect the thermometer, if placed near to or in contact with them; this must therefore be avoided.

"Observations by the Thermometer must be made every morning, before sunrise, in order to obtain the lowest degree; every afternoon at three o'clock, or thereabouts, when it shows the highest degree; and every evening an hour after sunset. The lowest degree, or coldest weather, is supposed to occur, generally, between the commencement of daylight and sunrise; and the highest degree, or warmest weather, between two and four o'clock in the afternoon."

The daily mean was directed to be found by adding to the morning observation twice the afternoon observation, and twice the evening observation with the next morning's observation, and dividing their sum by 6. To ascertain the comparative result of this method, and the arithmetical mean of the three observations, the mean obtained by both rules was ascertained by Dr. T. ROMEYN BECK, during a period of four years of observation at Albany, with the following results.*

* See Transactions of the Albany Institute.

This comparison shows that the rule adopted for obtaining the mean temperature gave a result about one-third of a degree above the arithmetical mean. Twice during each day the temperature is equal to the mean, and if these periods were constant, a single observation would suffice; but experience shows that these moments vary considerably, and occur at a time when the temperature is changing most rapidly. The periods of daily maximum and minimum temperature are more constant, yet these are found to range through several hours. In general, they both occur a little sooner in winter than in summer, and they are very liable to be influenced by the state of the sky and direction of the wind. In climates where land and sea breezes prevail, the highest temperature often occurs before noon, and changes of the wind, in our own climate, may often produce similar results; so that although the afternoon observation, directed to be made at academies, was intended to represent the highest temperature of the day, exceptional cases would unavoidably occur.

THE RAIN GAGE first supplied to academies consisted of an inverted cone, attached a cylindrical vessel of one-eighth of its sectional area, at the bottom of which was a hollow floating bulb; from this float a thin graduated rod passed up through a bar placed across the mouth of the funnel, and the depth of rain was indicated by the degree to which the upright rod arose. After noting the depth the water was drawn off from below, the instrument was ready for a new observation. This rain gage is shown in Plate I, fig. 1, in which *a c b* represent the funnel, *d* the float, *e d* the rod passing through the bar *a b*, at which the reading was made. This instrument was directed to be placed remote from all elevated structures, to a distance at least equal to their height, and still further off when convenient, and not more than ten feet above the surface of the ground. In freezing weather, when the rain gage could not be used out of doors, the observers were directed to substitute a tin vessel, with an aperture exactly equal to that of the rain gage, and wider below, in which the rain, sleet and snow might be caught. The contents being melted and poured into the rain gage, its depth, thus ascertained, was entered in the register.

In 1833, the Regents resolved that each of the academies subject to their visitation should be furnished with a *conical rain gage*, upon which observations were to be made at the same time with those previously furnished, and the results of both were directed to be reported, in order to determine their comparative value. This instrument was of very simple construction, consisting of an inverted cone, into which a conical cap was loosely fitted, which, while it allowed whatever rain fell upon it to pass down, prevented evaporation.* Plate 1, fig. 2, represents this instrument, in which *a b c d* is the rain gage, *e f g* its cover, and *s* the accompanying scale. An observation was made by taking the vertical depth of water by a thin rod, and measuring the portion that was wet upon the scale, which was so graduated as to show the corresponding depth of a cylinder of water having the same diameter as the mouth of the gage. The conical rain gage had the peculiar excellency of showing small quantities of rain with great accuracy, the graduation of the scale indicating hundredths of an inch for the first three-tenths, and above that, tenths and half tenths. Like the other, this gage was directed to be suspended on a post, about eight feet from the ground; and, in protracted rains, repeated observations were to be made before the depth was such that the corresponding graduation of the scale was crowded.

Comparative observations, made at the same locality but at different altitudes, have shown that the quantity of rain indicated depends much upon the height of the instrument, and that, in general, the most rain would be received in the rain gage nearest the surface. Observations made at the New-York Institution for the Deaf and Dumb, in 1845, '6, upon instruments five and eighty-five feet from the ground, gave, in a period of sixteen months, 60, 2, and 44, 7 inches respectively, a difference of 15, 5 inches. Similar observations at York, in England, at elevations of 0, 43 $\frac{2}{3}$, and 213 feet from the surface, gave, in four years (1832, '3, '4, '5), an annual mean of 22, 17 and 13 inches. It was there observed that the decrease, upwards, was less in warm than in cold weather, from which it may be inferred that it would be less in low than in high latitudes.

The number of days on which it rained, or snowed, or both, whether for a longer or a shorter period, was directed to be entered in columns reserved for these purposes; but, in examining the returns, it will be found that fractions were frequently entered, indicating that *half days*, instead of entire days, were noted, for which reason no attempt was made to obtain the mean and total of these items, excepting at the Albany station.

* See the American Journal of Science and Arts, First Series, Vol. xxii, Page 321.

The register, in which observations of each month were entered, was ruled into ten vertical columns, in the first of which were the days of the month; the second, third and fourth, the morning, afternoon and evening observation of the thermometer; in the fifth, their mean, found by the rule previously mentioned; in the sixth and seventh, the prevailing direction of the wind, in the forenoon and afternoon, indicated by the initial letters of the eight half quarters of the compass; in the eighth and ninth, to be headed "weather," the words "clear," or "cloudy," according to the prevalence of the one or the other aspect of the sky in the forenoon and afternoon; and in the tenth column, the depth of rain or snow, as shown by the rain gage. No particular hours were observed for taking the observation upon the direction of the wind or the aspect of the sky, it being understood that the general prevalence, during each half day, should afford the subject of entry. The various items entered in the record were added up separately by half months, and at the end of each month the results of both halves were noted. At the end of the record, an abstract showing the results of each month, and of the whole year, was directed to be added, from which the annual tables in the reports of the Regents were mostly derived.

One blank page to each month was appropriated to observations on vegetation; and also such miscellaneous remarks as might be considered interesting, such as thunder and lightning, hail storms, tornadoes or hurricanes, destructive floods, uncommon meteors, white or hoar frost, the first appearance of barn swallows in the spring, and occasionally the depth of snow on the ground, and its disappearance, &c.

The Observations upon the phenomena of vegetation were directed to the time when the white or red currants blossom; when the shad bush (*Amecanthier canadensis*) and dogwood trees (*Cornus*, several species), in their natural situations, are in blossom; and the peach, pear and apple trees, in open fields, are in bloom; or when at least one-half of all the blossoms were fully expanded; when the aments or flowers of the white oak, the chestnut, the black birch, and the aspen begin to drop; when ripe field strawberries first appear in any quantity; when the *last killing frost* occurs in the spring, observed on tender buds, young leaves, or the germs of fruit trees, or other vegetables; and the *first killing frost* in the fall of the year, noticed by its destroying tender plants, such as the vines of cucumbers, melons and beans. To these were frequently added, miscellaneous notes upon periodical phenomena.

Observers were required to report their elevation above tide, if ascertained, or if not, the relative height of their stations, with reference to some point ascertained by canal or railroad surveys, together with the latitude and longitude, or such information in relation to distances from town lines, as would enable one to determine these from the county maps. It was also recommended that the temperature of wells should be ascertained, in winter and in summer, the depth at which the observation was made being stated.*

On the 28th of March, 1832, the Regents, upon the recommendation of a committee, consisting of the Chancellor, and Messrs. DIX and BLEECKER, to whom was referred a suggestion from the trustees of Geneva College, reported in favor of urging upon the colleges and academies subject to their visitation the importance of observing, at least once in a year, the *azimuth of the magnetic meridian*, with the view of ascertaining the annual changes in the direction of the magnetic needle. As the Regents were not invested with the power of enjoining these observations, the measure was strongly recommended, and concise directions were given for making observations upon the pole star at its greatest azimuth, with the view of finding the true meridian, by comparison of which, the variation might be determined. The circular letter, in which this subject was first submitted to the colleges and academies, concluded with the following remarks:

"In regard to the subject now presented to your notice, the Regents claim no mandatory authority, especially over colleges; it therefore comes to you as a recommendation, that you will coöperate with those who preside over other institutions, for carrying into effect a measure deemed important for the promotion of science, and which may be considered of still greater importance in matters touching conflicting claims between individuals of our State. It is therefore hoped,

* As we descend below the earth's surface, the range of temperature rapidly diminishes, till at a depth of thirty or forty feet it becomes uniform, and nearly that of the annual mean of the locality. Beyond this it progressively increases with the depth, as proved in mines and artesian wells. This increase, if uniform, would give a temperature of boiling water at a depth of about two miles. Thermal springs are supposed to have their sources from great depths. Those of New Lebanon, in Columbia county, have a constant temperature of 75°. The brine raised at Syracuse, from wells bored to the depth of from 250 to 400 feet, show a constant temperature of 52°. The above suggestion of the Regents was only acted upon by a few observers, and for short periods.

that, impressed with a due sense of the general purposes for which the institution over which you preside has been created, this representation, made on behalf of the Regents, may not be disregarded, and that hereafter they may be furnished by the colleges and academies, in their annual reports, with observations made by them on the direction of the magnetic needle, compared with that of the true meridian, and that a detailed account be given, by each, of the manner in which its meridian line has been established."

About fifty observations were made accordingly, which are comprised in the table on this and the following pages. Other observations are included, derived, in part, from a valuable article by Professor E. LOOMIS,* and in part from records in the office of the Secretary of State at Albany.

As early as 1808, the Legislature, on the representation of Mr. SIMÉON DE WITT, Surveyor-General, passed a concurrent resolution, directing that officer to adopt such measures as he might deem expedient for observing the variation of the needle in different parts of the State, and to report his proceedings.† No special report was made; but in many of the surveys, executed under his direction, this variation is recorded. The importance of this subject should lead to the determination of the true meridian, and its preservation by permanent monuments, at one or more places in each county in the State, at which local surveyors might determine the azimuth of the magnetic needle, for noting in their surveys.

					Prof. C. Davies.

In their annual report for 1833, the Regents published the circular of the British Association for the Advancement of Science, containing directions for observing the *Aurora Borealis*, and solicited an obedience to its instructions. The particular data desired, were facts tending to establish the *height* of the aurora, the *sounds* said to accompany it at times, its *periods* of appearance, and relative frequency in different years, and its *effect upon the magnetic needle*.

To obtain uniform results, it was advised to examine the sky, and enter the presence or absence of auroras, at 10 P. M. (Greenwich time), and this observation to be continued one hour. The connection with clouds, if any were visible, and its distance relative to them; the nature of the *black mass*, sometimes seen under luminous arcs, whether mere contrast with the enlightened part, or of a cloudy nature; its transparency or opacity, and the way in which it vanishes; the breadth and apparent velocity of streamers, as determined by stars; their lateral motion, and their relation to arcs or clouds, were to be carefully observed. The southward motion of arcs should also be determined, by observing the time between their

* A line drawn from a point in the Pennsylvania boundary, 82 miles west of the Delaware river, north to Great Sodus Bay, on Lake Ontario; passing through a portion of Seneca lake.

† The places of observation on this line were, respectively, 6, 8 $\frac{1}{2}$, 14, 22, 24 $\frac{1}{2}$, 30, 33, 37, 40 $\frac{1}{2}$, 42 $\frac{1}{2}$, 45 $\frac{1}{2}$, 49, 60, 70, 75 and 81 miles north of the Pennsylvania line.

passing over different stars; and any changes which may occur in their form noted, or any defect of symmetry. The determination of elevation can scarcely be applied to the streamers of aurora, except when some sudden incurvation or change occurs, which may happen to be noticed at two stations; but the arcs are of a less evanescent nature. For them the altitude above the horizon, and the azimuth with respect to the *true* meridian, are required. It must be observed that the aurora is not visible in telescopes, and therefore these elements are not susceptible of such precision as to make large instruments necessary or even useful. A small theodolite, or one of the little altitude and azimuth circles, invented by Captain Kater, in which the telescope is replaced by a tube having two cross wires at one end and a sight hole at the other, is all that is requisite. Having leveled the instrument, intersect with the wires the *lower edge of the arc* (which is always the best defined) *at its summit*, and read both circles.

The position of the point of convergence of the streamers and of the summit of the arcs, the variation in intensity of terrestrial magnetism, as shown by changes of the horizontal and the dipping needles, were indicated as important data for observation, and directions for ascertaining them were given.

The directions for recording auroras were followed at some of the stations with much care; and at others, notices and descriptions of the aurora were given in detail, with numerous facts of interest, in proving the extent and changes of this beautiful phenomenon. During the entire period, the aurora was recorded on 1,542 days, or about 62 days in each year, which were distributed through the different years and months in the proportion given on page 472.

To indicate the extent of territory over which auroras were simultaneously observed, a list of stations, derived from scientific journals and other records, is added, consisting only of names of places; at the end of which, the detailed descriptions reported by academies are inserted, forming, together, an extensive and valuable collection of data in this special branch of physical science.

The facts embodied in these tables show a progressive increase in frequency of auroras, from December to April; a decrease in May and June, and the greatest frequency in September. They further indicate, that the number of auroras varies with different years, and that the years 1830, 1840, 1841, 1848, 1849 and 1850 were remarkable for the frequency, while 1828, 1829, 1832, 1835, 1844 and 1845 were characterized by the fewness of days on which they were observed.

The table of days on which *solar* and *lunar haloes* were observed in the several months and years, given on page 471, shows that the greatest number of the former were noticed in the spring months, and of the latter in winter, while the fewest occur in summer; a period when the region of the temperature of congelation necessary to their production is most elevated. Haloes being produced by the refraction of light passing through minute crystals of ice floating in an atmosphere of a temperature below 32° F., must occur, like the rainbow, whenever the conditions of their production coëxist; and they only become of peculiar scientific interest, when seen in unusual size, or with a combination of arcs, indicating extraordinary conditions of form in the refracting bodies, or a peculiarly favorable atmosphere for their appearance.

On several occasions, these unusual haloes have been recorded, figures of which are given on plate I. These arcs are generally parts of circles, having the sun or the zenith as their centres, but occasionally they are described as elliptical or parabolic, which appearances may perhaps be produced by circles having their planes oblique to the observer. The intersection or over-lapping of arcs produces luminous spots denominated parhelia, when seen in solar haloes, which sometimes have conical appendages on the side opposite the sun, consisting of parts of the circles in which they are produced. Vertical columns passing through the sun or moon are occasionally seen, generally when crystals or frost are falling, which are usually white, and observed near the time of sunrise or sunset, but occasionally they are tinged red, or seen passing through the sun when several degrees above the horizon. One of these vertical columns is shown in plate I, fig. 13. A horizontal and a vertical bar of light passing through the moon and limited by a circular halo around it, as shown in fig. 16, form the principal complications seen in lunar haloes, the intensity of the light being insufficient for rendering visible the more complex arcs, should the atmospheric conditions be favorable for their production. When these bars of light are seen across the moon, crystals of frost are generally falling, the reflections of which may, perhaps, be adequate for their production.

The results of observations upon temperature, during the entire period embraced in this volume and at all of the stations, gives a general annual average of 46,74 degrees, and that of the several months, the following :

Months.	First half	Second half	Whole month	Months.	First half	Second half	Whole month
January,	25,17	24,19	24,68	July,	69,12	70,23	69,67
February,	21,63	26,59	24,11	August,	69,94	66,99	68,46
March,	31,02	35,86	33,44	September,	62,14	57,60	59,87
April,	43,05	47,58	45,30	October,	50,49	46,05	48,27
May,	53,37	59,06	56,21	November,	41,24	34,11	37,67
June,	63,71	67,49	65,60	December,	29,19	25,30	27,24

The station having the highest annual mean, is Erasmus Hall (51,62). The following stations exhibit a mean above the general average of the State, viz: Albany, Cayuga, Clinton, Dutchess, Erasmus Hall, Farmers' Hall, Franklin (Prattsburgh), Fredonia, Greenville, Hudson, Ithaca, Kinderhook, Kingston, Lansingburgh, Lewiston, Middlebury, Montgomery, Mount Pleasant, Newburgh, New-York, North Salem, Onondaga, Oyster Bay, Redhook, Rochester, Syracuse and Union Hall. At all others it is below; being less than 44° at Bridgewater, Fairfield, Franklin (Malone), Gouverneur, Lowville, Ogdensburgh, Oneida Conference Seminary, Pompey and St. Lawrence. The extreme range of temperature throughout the whole time and at all the stations, was 145°. The greatest range was observed at Gouverneur, and the least at Oyster Bay. In general, the extremes were found to vary *less*, as the mean temperature was *higher*; the annual extremes of seventeen stations, which were less than 100° having with one exception, a mean above that of the whole state. The mean temperature of Malone, Potsdam, Ogdensburgh and Gouverneur; stations situated north of the great forest of Hamilton and adjacent counties, differs but half a degree; a uniformity observed among no other stations of equal number in the State.

Although geographical position has a decided influence upon the mean temperature of a place, that of altitude (other things being equal), is found to have greater; and there is often noticed between stations but a few miles apart, but at different elevations a decided difference, which can be ascribed to no more probable cause. Between Onondaga and Pompey the difference of elevation is about 850 feet, and the respective mean temperatures are 47,18 and 42,83. A comparison of the facts exhibited on page 461, will afford other but less striking examples, as between Utica and Fairfield or Bridgewater; between Poughkeepsie and Amenia; between Newburgh and Goshen, &c. The decrease of temperature upon mountains, is a familiar fact to travellers; and although there are no mountains within the State that rise to the summer altitude of congelation, the vegetation of their summits partakes of an Alpine character, and they are visited with frosts every month, and almost every week in the year.

A vicinity to lakes, or bodies of water, is found to exert an equalizing influence upon the temperature; as of 22 stations, at which the mean annual range is below that of the State, all but one are in the vicinity of lakes or large rivers.

The temperature of the months, is observed to increase from the first half of February, to the last half of July; from which period it regularly returns to its minimum in February, as shown in the foregoing table. To this rule there are no exceptions, unless in those stations at which the records were kept but a short time, in which the results may be influenced by the deviations of particular years. The mean of the second half of April, and of October, in the general aggregate, and at most of the stations, differs but little from the annual mean. If the temperature of the several months be represented by a curve, as shown in the accompanying diagrams, in which the relative distance from the axis, or base line, indicates the degree of temperature; the results of a few years will seldom fail to produce much regularity of form, and the effect of long continued observation would be, to correct the irregularities arising from the disturbing causes or peculiarities of particular seasons.

There is probably no station in the State, at which the temperature and other data, obtainable from mean results, are better known than Albany; as there are preserved two years observation by Mr. SIMÉON DE WITT, in 1795 and 1796; two years by Dr. J. EIGHTS, in 1813 and 1814; and six years by Dr. T. R. BECK, preceding the time when the series embraced in this volume commenced, making an aggregate of 34 years, besides that since taken.

The results of the preceding series, combined with that from 1826 to 1849, are contained in the following table :*

YEARS.	THERMOMETER.						WEATHER. [DAYS.]					WINDS. [DAYS.]

One of the most striking results of the observations upon the winds is the correspondence between their direction and that of the valleys in which the stations are located. At most of those on the Hudson, northerly and southerly winds were recorded in the greatest number ; in the Mohawk valley, easterly and westerly or northwesterly winds ; and at nearly every other place, the prevailing direction of the neighboring hills and valleys was found to influence that of the surface current. This is shown in the diagrams accompanying this work, termed "wind roses," in which the longest diagonal of the figure is generally that of the local valleys of the station. As no record of the velocity of the winds was made, the general average for long periods would not probably vary far from the actual result, if estimated as uniform ; upon which assumption the *resultant* of each month and year has been computed, for the purpose of determining the absolute motion and direction of the winds, with reference to the locality where observed.†

If we attentively observe the general topographical features of the State of New-York, we shall notice that the prevailing direction of the hills and valleys is more or less northerly and southerly, the principal exception being the narrow and deep valley of the Mohawk. Lake Champlain may be said to lie in a continuation of the Hudson river valley, and the ridges

* This table is condensed from one communicated to the Albany Institute, and published in their Transactions, and in the Regents' Reports for 1833. The observations by Mr. De Witt, were taken in Dean-street ; those of Dr. Eights, in Steuben-street in 1813, and in North Pearl-street in 1814 ; and those by Dr. Beck, at the Academy. In 1813, 1814, the records were made at 7 A. M., 3 P. M. and 9 P. M. ; and those after 1820, at 7 A. M., 2 P. M. and 9 P. M.

† The problem to be determined in this case is similar to that for finding the position and distance, from her starting point, of a vessel that has sailed with a uniform velocity in different known directions. Let plate II, fig. 1, represent the track of such a vessel, that has sailed from the point *a*, north, 2,81 days ; northeast, 2,32 days ; east, 1,26 days ; southeast, 2,44 days ; south, 4,76 days ; southwest, 5,42 days ; west, 5,54 days, and northwest, 6,04 days ; the position, at the end of the time, would be at *b*, a point south 80° west from *a*, and at a distance of 9,16 day's voyage (or about 80 per cent of the whole distance sailed) from the place of beginning. The above numbers are the average number of days in a month which the wind has been observed to blow from the several points, and the direction *a b* is the *resultant* of the winds. It is in effect the same as if the wind had blown from a point S. 80° W. 9,16 days, and during the remaining part of the month it had been calm. In computing this, the *eight* directions are reduced to *four*, by subtracting opposite points ; these reduced to *two*, by means of a traverse table, and these two to *one*, by the aid of logarithms, in the ordinary method of finding the hypothenuse and angles of a right angled triangle, when the base and perpendicular are known. If the numbers representing the winds of any locality be drawn, as in fig. 2, it will be found that the diagram will be elongated in the direction of the neighboring hills and valleys, although the resultant may show a direction *directly across them*. Fig. 20 represents the relative prevalence of winds at Utica, in the valley of the Mohawk, and fig. 3 those of Kinderhook, on the Hudson.

which border both the lake and the river have the same general direction. The country north of the Mohawk is traversed by several ranges of mountains, some of which, towards their northern limit, rise to the height of nearly a mile, with a general northeasterly and southwesterly trend, and having the intervening valleys and chains of lakes elevated about 1,600 feet above tide. These ranges sink into plains a little north of the Canada line, and from their northern slopes they command an extensive view of the St. Lawrence river, and the level country along its banks, to a great distance.

The Catskill mountains have a general northwesterly course, and the highlands of Orange a northeasterly one, while the prevailing direction of the hills and valleys of the central and western portions of the State is north and south; this being the longest direction of most of the inland lakes, and the general course of the rivers and streams. The counties of the State bordering upon Pennsylvania are wholly or in part drained by the head waters of the Allegany, Susquehanna and Delaware rivers, between which occur ranges of hills constituting prolongations of the Allegany mountains, having the prevailing direction of the latter.

After what has been remarked concerning the influence of local causes in giving direction to the wind, with the general fact that this influence should produce a prevalence of northerly and southerly winds, we still observe that at nearly every station there is a strong tendency to a direction from the west, *across* the hills and valleys, as shown by the resultants; and are led to the inference that there is a general and far-prevailing cause, which observations made elsewhere proves to extend throughout a considerable portion of the northern hemisphere, in which there is a strong and almost entire prevalence of westerly winds. In a valuable memoir upon the winds of the northern hemisphere, published by the Smithsonian Institute,* this zone of westerly winds is stated to be about $23\frac{1}{2}^{\circ}$ wide, entirely encircling the globe, and not coinciding with the parallels of latitude, but having its pole at about latitude 84° and longitude 105° W. from Greenwich. This zone embraces nearly the whole of the United States; and of 251 stations, all but 6 had the mean direction of the wind westerly, the rate of progress being commonly greater as the direction approached a west point. The average rate at all of the stations was 30 per cent, while at the exceptional ones it was but 18. So far as the results of this State extend they confirm this general statement.

Of the 62 stations embraced in the following pages, 34 have the mean direction of their winds south, and 28 north, of that of the whole State. Of these there are within

	5	degress	of S.	80°	W.	4	north	and	10	south
10	"	"	"	"	"	2	"	"	7	"

40	"	"	"	"	"	1	"	"	1	"
over 40	"	"	"	"	"	2	"	"	0	"

With a single exception, the mean directions are embraced within an arc of $111^{\circ} 11'$ from S. 34° W. to N. $34^{\circ} 49'$ W.

In reference to the relative prevalence of winds in different months it is to be observed that the winds are in general more northerly in the first half of the year, and more southerly in the other half, than the annual average; therein corresponding with observations made elsewhere within the United States, but the opposite to that noticed in Europe. This is attributed by Prof. Coffin, in the memoir above cited, to the fact that, during the winter, the Atlantic Ocean is warmer than the adjacent continents, and that, necessarily, there must be a tendency of the colder air from the land to the sea; while in the opposite season, the land being warmer, the direction of the winds is reversed; thus giving to them of our latitude the character of *monsoons*, although in a slight degree, compared with that of the Indian Ocean, where, from peculiar

* "Winds of the Northern Hemisphere, by James H. Coffin, A. M., Professor of Mathematics and Natural Philosophy in Lafayette College, Easton, Pa." Washington, 1853. Smithsonian Contributions to Knowledge: Vol. VI., Part V.

circumstances, they are strongly characterized, and return with much regularity. The winds of July are, in general, nearly coincident in direction with the annual mean.

The aspect of sky, as observed throughout the State for a quarter of a century, indicates a prevalence of clear over cloudy, in the proportion of $15\frac{1}{2}$ to $14\frac{3}{4}$, and a progressive increase of serene sky from December to July, from which it declines to the following December.* The number of cloudy days exceeds those that are clear, at 27 of the 62 stations. At Clinton academy, near the east end of Long Island, the greatest amount of clear sky is recorded, and at Springville, near Lake Erie, the least; the extremes differing about 28 per cent of the whole time. So far as a generalization can be applied, those stations adjacent to lakes, and those exceeding 800 feet in altitude above tide, have an excess of cloudy days. The relative amount of clear and cloudy sky in the several months, is shown on page 462, and by fig. 28, in which the shaded portion bears the same proportion to the whole area of the figure, as the number of cloudy days, to the whole number of days in a year. The months of March and October have a mean approaching that of the whole year, the relative amount of serene sky being greater in summer, and of cloudiness in winter. As no scale of cloudiness was adopted in these observations, they do not show how far the formation of cloud is influenced by the direction of the wind, by temperature, barometer pressure or hygrometric conditions. These must remain to reward the future comparison of simultaneous observations over an extended district. It is commonly noticed in this State, that continued north and northwest winds bring a clear sky and low temperature, while southerly and easterly winds almost invariably bring clouds and rain, especially if they continue with violence during a few hours.

Easterly winds in North America, bear the same relation to rains, that westerly winds do in Europe, for in each case the humid air from the Atlantic is brought over the continent, where (upon cooling) it must precipitate its moisture. With us, northeasterly storms are proverbial for their inclemency, while northerly and northwesterly winds (bringing atmosphere from which the moisture has been previously condensed,) have a chilling, but not a rainy character.

Observations upon the *rain gage*, indicate that the maritime region of the State, and the valleys of the Hudson, Mohawk and Susquehanna, receive more rain than other sections; that the least rain falls in the valley of the St. Lawrence, and that the rains of the western part of the State, and the region of the great lakes, are below the general average. The annual mean for the whole period was 34,90 inches, being at 29 stations greater, and at 30 stations less, than this average. The greatest mean depth reported, was at New-York (46,26), and the least at Lewiston (22,23); the annual mean being less than 28 inches at Lewiston, Buffalo, Gouverneur, Monroe, Ogdensburgh and Potsdam, while it was 40 inches and upwards at Albany, Bridgewater, Cambridge, Cherry Valley, Delaware, Jamaica, New-York, North Salem, Oyster Bay, Schenectady and Utica.

The depth of rain falling in the different seasons is found to be greatest in summer and autumn, while it is least in winter and spring, thus affording a harmonious coincidence between the prevalence of ocean winds, as above stated, and depth of rain, and between land winds and drouth. The least depth of rain (including snow), falls in February, and the greatest in June; the quantity falling in August being nearly equal to the annual mean. From May to November it is greater, and during the remainder of the year it is less, than the general average. The curve drawn in fig. 29 exhibits the relative quantity of rain falling in the different months, and a comparative view of several interesting facts in connection with this subject. The quantity of rain falling in different years is found to vary considerably, as shown by a comparison of the annual summaries (p. 466 - 471), which were prepared for the purpose of showing the distinguishing features of the several seasons, and the extent to which the general result might have been affected by any peculiarities of individual years.

A comparison of this table, shows that the temperature of 1829, 1835, 1836, 1837, 1838, 1839, 1841, 1842 and 1843 was below the general average, while that of the other years was above. In the years 1826, 1829, 1834, 1835, 1836, 1838, 1839, 1841, 1844, 1845, 1846 and 1849, the quantity of rain was below the general average, while in all the other years it was above, being greatest in 1850 and least in 1834. The year 1830 was characterized by drouth in August, September

* The relative amount of clear sky, is greater with us than in Europe, from the reason, that their westerly winds are from the ocean, while ours are from the continent.

and October, followed by heavy rains, and unusual mildness of temperature in November and December, which occasioned vegetation to start up with the vigor of spring growth. In many places buds put forth, and trees blossomed in November. At Flatbush a second crop of pears attained half size; and peas and beans grew to their full size. At Potsdam, December 4th, marigolds were in full bloom, and thrifty mustard plants were seen six inches high.

In the month of August, 1831, an extraordinary atmospheric condition was noticed both in Europe and America. At many places in the former, an unusual brightness appeared in the west after sunset, enabling persons to read long after the usual hour, and the sun at times appeared shorn of its beams, as if by a scarcely perceptible vapor, giving it a violet tinge.

At Canajoharie on the 4th, the sun at 5 P. M., was endurable to the naked eye and presented a pale violet hue; and at Albany from the 12th to the end of the month, every evening after sunset, the western sky appeared tinged with a deep red.

On one afternoon, between the 12th and the 17th, the sun's disc was pale and silvery like the full moon and slightly tinged with green, and its light so diminished that the eye could rest upon it without pain. Similar conditions were described to the west and south.

On the morning of the 13th of November, 1833, a most extraordinary meteoric shower was observed, not only throughout the State, but over a great part of North America and at sea. The details of this, embracing all the observations reported by the academies of this State, have been often published in scientific journals and text books, to which the reader is referred for a particular description.

The year 1834, was noted for the early budding and blossoming of trees, followed by frosts and snow in May, proving destructive to fruit and destroying in the northern part of the State, hundreds of orchards. During the previous winter the snow had been deep and the ground had not frozen.

The relative forwardness of the seasons may be inferred from the times of the opening and closing of canals, lakes and rivers. The following table gives the date of the beginning and end of navigation on the Hudson, at Albany, during a long period:

River closed or obstructed by ice.	River open or free from ice.	Days closed.	River closed or obstructed by ice.	River open or free from ice.	Days closed.
February 3, 1790	* March 23, 1786		December 24, 1823	March 24, 1823	90
December 8, 1790	* March 27, 1790	52	December 16, 1823	March 3, 1824	78

April 16, 1846	November 25, 1846		224	April 11, 1846
May 1, 1847	November 30, 1847		214	April 23, 1847
May 1, 1848	December 9, 1848		223	April 9, 1848
May 1, 1849	December 5, 1849		219	March 25, 1849
April 22, 1850	December 11, 1850		234	March 25, 1850
April 15, 1851	December 5, 1851		235	April 2, 1851
April 20, 1852	December 16, 1852		239	April 20, 1852
April 20, 1853	December 20, 1853		245	April 14, 1853
May 1, 1854	December 3, 1854		217	April 29, 1854

There has been observed in the great lakes, an alternation of high and low water, extending through an indefinite term of years, and probably dependent upon the variable supply of rain which these lakes receive. The range extends through about five feet, and on Lake Erie, was observed highest in 1838, and lowest in 1819. At the east end of Lake Ontario, low water was observed, in 1803, 1804; 1808 to 1811; 1822 to 1828; and 1844 to 1850. High water was noticed in 1798; 1805 to 1807; 1812 to 1819; 1829 to 1831; 1837 to 1839; 1852, 1853. Charlevoix in 1721, noticed the changes of level in the surface of this lake. Long prevailing gales of west wind, cause a rise of several feet in the great lakes, as occurred at Buffalo, October 18, 1844, doing immense damage to property and destroying many lives.

The annual reports of the Regents, contain occasional records of phenomena which possess much interest from their unusual character, being such as are noticed and remembered by the most casual observer; such as destructive storms and tornadoes, unusual atmospheric refractions, dark days from dense clouds and smoke, water spouts, slight shocks of earthquakes, meteors of uncommon brilliancy and number, rain water covered with pollen dust, unusual radiations at sunset and physical phenomena of similar character, of which the limits of this volume do not admit the details.

The most common atmospheric refraction is noticed in distant objects seen across sheets of water, in which they appear raised above their proper places, and at distances beyond the ordinary horizon of the observer. Such refractions are of frequent occurrence upon Lake Ontario and elsewhere, in which the distant object appears elevated a little distance into the air, the sky appearing below as well as above it. These illusions commonly appear in warm days and clear weather. Water spouts have been repeatedly seen upon this lake, and on one occasion one was noticed, which upon reaching the shore, became a tornado, uprooting trees, and leveling whatever came within its track.

One of the most remarkable tornadoes on record, traversed the northern part of the State, September 20th, 1845, originating in Jefferson county, and crossing St. Lawrence, Franklin and Clinton counties, Lake Champlain, and a part of Vermont. The greater part of its course was through the forest, and its track was marked by prostrate and broken

trees, over a breadth of from forty to eighty rods. Many buildings were leveled, but no lives were lost. On the same day that this tornado occurred, a remarkable ebb and flow of the waters of Lake Ontario was noticed on the north shore, which was attributed to an earthquake. Other tornadoes were observed; in Clinton county, June 11, and at Cayuga, July 20, 1831; at Utica, August 14, 1834; at Kinderhook, June 19, 1835; at Redhook, June 3, 1836; and at other places.

Earthquake shocks were noticed; at Johnstown and vicinity, January 16th, at Potsdam, May 10, and at Malone, May 11, 1840; at Ellisburgh, September 28, 1842; at Rochester and Millville, September 19, and at Batavia, October 22, 1844; at North Salem, February 21, and October 26, 1845. The latter was noticed on Long Island in many places. At Mount Pleasant, September 3, and at Jamaica, Montgomery, New-York and North Salem, September 8, 1848; and in Jefferson and Lewis counties, March 12, 1853, earthquake shocks were sensibly felt. These convulsions were mostly limited to a rumbling, subterranean noise, and slight tremor of the earth's surface, but at times, the shocks have been sufficient to throw down chimneys and walls.

At Kinderhook, November 11, 1833, in the evening, phosphorescent lights were seen on the tops of sticks, posts and other pointed objects, some as large as the flame of a candle, having a dim white light pointing upwards. The atmosphere appeared unusually red.

The records of periodical phenomena, including the progress of vegetation, flight of birds, &c., as published in the annual reports of the Regents, embody a vast amount of useful data for reference, but are too varied and deficient for generalization until extended by future observation. In general they indicate the approach of spring and autumn about three weeks earlier on Long Island than in the northern part of the State.

Previous to May, 1841, the Hon. GIDEON HAWLEY, as secretary of the Board of Regents, had the general direction of the system of observations contained in the following pages, and subsequent to that period, Dr. T. ROMEYN BECK acted in the same capacity. To these gentlemen, and to the Board of Regents generally, is the public indebted for the care and general accuracy with which the system of observations embodied in the following pages were conducted.

F. B. H.

SUMMARY OF METEOROLOGICAL OBSERVATIONS,

MADE AT SUNDRY ACADEMIES IN THE STATE OF NEW-YORK, UNDER THE DIRECTION OF THE REGENTS OF THE UNIVERSITY,
FROM 1825 TO 1850 INCLUSIVE.

The following list embraces the names of the institutions at which these observations were made, their location, number of entire years during which they were complete, and the number in which the temperature, direction of winds, aspect of sky and depth of rain were recorded.

[In the following table, T, represents TEMPERATURE; W., WIND; S., ASPECT OF SKY; and R., RAIN GAGE.]

NAMES OF ACADEMIES.	WHERE LOCATED.	YEARS REPORTED.					YEARS DURING WHICH RECORDS WERE KEPT.
		Entire.	Temper- ature.	Winds.	Aspect of Sky.	Rain gauge.	
Albany Academy,.....	Albany, Albany Co.,.....	24	24	24	24	24	1826 to 1849 inclusive.
Amenia Seminary,.....	Amenia, Dutchess Co.,	0	1	1	1	0	1849 (ex. R.)
Auburn Academy,.....	Auburn, Cayuga Co.,	22	22	22	22	22	1827, '8, '9, 1830, 1832 to 1849 inclusive.
Bridgewater Academy,.....	Bridgewater, Oneida Co.,.....	4	4	4	4	4	1833, '4, '5 '7.
Buffalo Lit' and Scient' Academy,	Buffalo, Erie Co.,.....	1	2	2	2	1	1831 (ex. R.); 1832. [(ex. R.)
Cambridge Washington Academy,	Cambridge, Washington Co.,.....	13	14	14	14	13	1827, '8, '9, 1830 to 1839 inclusive, 1841
Canajoharie Academy,	Canajoharie, Montgomery Co.,...	0	3	2	2	0	1830 (T.); 1833 (ex. R.); 1835 (ex. R.)
Canandaigua Academy,.....	Canandaigua, Ontario Co.,.....	10	10	10	10	10	1829 to 1838 inclusive.
Cayuga Academy,.....	Ledyard (Aurora), Cayuga Co.,...	7	13	13	13	7	1830, '1, '2, '4; 1838 (ex. R.); 1840 (ex. R.); '2 (ex. R.); '3 (ex. R.); '4, '5 (ex. R.); 1846 (ex. R.); 1850.
Cherry Valley Academy,.....	Cherry Valley, Otsego Co.,	14	15	15	15	14	1827 to 1831 inclusive; 1832 (ex. R.); 1833, '4, '5, '6; 1841 to 1845 inclusive.
Clinton Academy,	East Hampton, Suffolk Co.,	16	17	17	17	16	1827 to 1842 inclusive; 1843 (ex. R.)
Cortland Academy,.....	Homer, Cortland Co.,.....	0	18	18	18	0	(R. not recorded) 1832, '3, '5, '6, '7, '8, '9; 1840 to 1850 inclusive.
Delaware Academy,	Delhi, Delaware Co.,	2	2	2	2	2	1828, 1837.
Dutchess County Academy,.....	Poughkeepsie, Dutchess Co.,	14	16	16	16	14	1829 (ex. R.); 1830, '1, '2, '3, '4 (ex. R.); '5, '6; 1841 to 1847 inclusive, 1849.
Erasmus Hall,	Flatbush, Kings Co.,	24	24	24	24	24	1826 to 1849 inclusive.
Fairfield Academy,	Fairfield, Herkimer Co.,.....	18	19	19	19	18	1827, '8, 1831, '2, '3 (ex. R.); 1835 to 1845 inclusive; 1847, '8, '9.
Farmers' Hall,	Goshen, Orange Co.,.....	8	11	11	11	8	1835, '8, '9, 1840, '1 (ex. R.); '2, '4 (ex. R.); '5 (ex. R.); '6, '7, '9.
Franklin Academy,.....	Malone, Franklin Co.,.....	3	3	3	3	3	1839, 1840, '2. [R.]
Franklin Academy,.....	Prattsburgh, Steuben Co.,.....	9	10	10	10	9	1829, 1830, '9, 1840, '1, '2, '3, '4, '5, '6 (ex. R.); 1830, '1, '2, '4 (ex. R.); 1835 to 1840 inclu- sive; 1841 (ex. R.); 1842 to '8 inclusive.
Fredonia Academy,.....	Pomfret, Chautauque Co.,.....	16	18	18	18	16	1839 to 1842 inclusive.
Gaines Academy,.....	Gaines, Orleans Co.,.....	4	4	4	4	4	1831 (ex. R.); 1832 (ex. R.); 1833, '4, '5, '8, '9, 1841, '2, '3 (ex. R.); '4, '5.
Gouverneur Wesleyan Seminary,	Gouverneur, St. Lawrence Co.,...	9	12	12	12	9	1835, '6; 1838 to 1849 inclusive.
Granville Academy,	Granville, Washington Co.,.....	14	14	14	14	14	1826.
Greenville Academy,.....	Greenville, Greene Co.,.....	1	1	1	1	1	1827 (ex. W. & S.); 1828, '9, 1830, '1; 1832 (R.); 1833, '4, '5 (ex. R.); '6, '9, 1842 to '9 inclusive.
Hamilton Academy,.....	Hamilton, Madison Co.,.....	17	18	17	17	17	1826 to 1832 inclusive; 1835, '7, '9, 1845, '6, '7 (ex. R.); '8, '9 (ex. R.); 1850.
Hartwick Seminary,	Hartwick, Otsego Co.,.....	14	16	16	16	14	1827, '8, '9, 1831, '2, '3, '4, '5, 1841 to 1849 inclusive.
Hudson Academy,.....	Hudson, Columbia Co.,.....	17	17	17	17	17

SUMMARY OF OBSERVATIONS AT ALBANY ACADEMY,

ALBANY, N. Y., DURING TWENTY-FOUR YEARS.

Latitude N. 42° 31'; Longitude W. 73° 44' from Greenwich. Elevation above tide 130 feet. On the west side of the valley of the Hudson, and on the edge of a plain extending back to the valley of the Mohawk.

OBSERVERS.

From 1826 to 1841, inclusive, T. ROMEYN BECK, M. D., Principal.
 " 1842 to 1847 " T. ROMEYN BECK, M. D., Principal, and Dr. TEN EYCK, Professor.
 1848, T. ROMEYN BECK, M. D., Rev. WM. H. CAMPBELL, and Professors TEN EYCK and COOK.
 1849, Rev. WM. H. CAMPBELL, Principal, and GEORGE H. COOK, Professor of Mathematics.

SUMMARY OF OBSERVATIONS AT AUBURN ACADEMY,

AUBURN, CAYUGA COUNTY, N. Y., DURING TWENTY-TWO YEARS.

Latitude N. 42° 55'; Longitude W. 76° 28'. Elevation above tide 650 feet. In the valley of the outlet of the Owasco lake, about 100 feet below the lake, and 250 feet above the Erie canal at Port Byron.

OBSERVERS.

1827, '8, '9, Rev. JOHN C. RUDD, Principal.	1836, A. FISK and WILLIAM HOPKINS, Principals.
1830, Rev. J. C. RUDD and OLIVER S. TAYLOR, Principals.	1837 to 1843, WILLIAM HOPKINS, Principal.
1832, '3, '4, '5, ALLEN FISK, Principal.	1844, not stated.
1845 to 1849, WILLIAM HOPKINS, Principal.

SUMMARY OF OBSERVATIONS AT BRIDGEWATER ACADEMY,

BRIDGEWATER, ONEIDA COUNTY, N. Y., DURING FOUR YEARS.

Latitude N. 42° 55'; Longitude W. 75° 17'. Elevation 1,286 feet above tide. In the valley of the west branch of the Unadilla river.

OBSERVERS.

1833, J. F. TROWBRIDGE, Trustee, and U. WHIFFEN, Principal.

1834, U. WHIFFEN and HIRAM WHEELER, Principals.

1835, (ex. clear and cloudy days,) HIRAM WHEELER and THOS. I. KUGER, Teachers.

1837, HENRY O. SOUTHWORTH, Principal.

Highest degree, July 9, 1834, 94°
 Lowest degree, January 7, 1835, -31
 Extreme range in 4 years, 125
 Greatest monthly range in March.
 Least monthly range in July.
 Mean monthly range, 70½°.
 Driest month, November.
 Wettest month, June.
 Total fall of rain and snow in 4 years, 14 feet 7.07 inches.

Highest degree, July 7, 1832, - - - - - 92°
 Lowest degree, February 24, 1832, - - - - - -22
 Extreme range in 2 years, - - - - - 114

Mean monthly range, 55½°.
 Total fall of rain and snow in 1832, 27.27 inches.

Mean results of winds:—North, 8,25; Northeast, 48,23; East, 25,75; Southeast, 34,25; South, 26,75; Southwest, 141,75; West, 85; Northwest, 37,5.
 Mean direction of wind:—S 44° 34' W; Per cent, 32; Days, 115,39.
 Weather:—Days clear, 181; Days cloudy, 184,5; Days rain, 36; Days snow, 20.

SUMMARY OF OBSERVATIONS AT CAMBRIDGE WASHINGTON ACADEMY,

CAMBRIDGE, WASHINGTON COUNTY, N. Y., DURING 14 YEARS.

Latitude N. 43° 01'; Longitude W. 73° 23'. On the Hoosic river, an eastern branch of the Hudson.

OBSERVERS.

1827, MATTHEW STEVENSON, M. D.	1832, WILLIAM D. BEATTIE, Principal, and MATTHEW STEVENSON, M. D.
1828, REV. N. S. PRIME, Principal and MATTHEW STEVENSON, M. D.	1833, MATTHEW STEVENSON, M. D.
1829, REV. NATHAN S. PRIME, Principal.	1834 to 1838, WILLIAM D. BEATTIE, Principal.
1830, REV. N. S. PRIME and J. MONTEITH, Principals, and MATTHEW STEVENSON, M. D.	1839, WILLIAM D. BEATTIE and ADDISON LYMAN, Principals.
1831, JOHN MONTEITH, Principal, and MATTHEW STEVENSON, M. D.	1841, (ex. rain gage,) ADDISON LYMAN, E. H. NEWTON and RUSSELL M. WRIGHT.

SUMMARY OF OBSERVATIONS AT CANAJOHARIE ACADEMY,

CANAJOHARIE, MONTGOMERY COUNTY, N. Y., DURING THREE YEARS.

Latitude N. 42° 53'; Longitude W. 74° 35'. Elevation above tide, 284 feet. On the west side of the valley of the Mohawk, estimated to be 50 feet above the canal at this place.

OBSERVERS.

1830, Temperature alone complete, ADAM BULLOCK, Teacher.

1835, Except rain gage, WILLIAM PALMER, Principal.

1833, Except rain gage, WILLIAM PARKER, Principal.

SUMMARY OF

OBSERVATIONS AT CAYUGA ACADEMY,

LEDYARD, CAYUGA COUNTY, N. Y., DURING 14 YEARS.

Latitude N. 42° 43'; Longitude W. 76° 37'. Elevation above tide, 447 feet. Elevation above Cayuga lake, 60 feet.

[The village of Aurora is situated on the east bank of Cayuga lake, twelve miles south of Cayuga Bridge, and sixteen and a half southwest from Auburn. The breadth of the lake at this place is four miles, and its depth, as found by actual measurement, is two hundred and eighty feet. The Academy is situated a few rods from the shore of the lake. The severity of the winter is much mitigated by the vicinity of the lake, which has never been frozen over opposite to this place for any length of time. The lowest degree in 1826-7 was —2. Snow is also rare. It frequently, in the winter, rains here, when a few miles east it snows. In the spring it is found that vegetation along the shore commences about ten days earlier than it does five miles east. The winds are very variable and unstable. They not unfrequently in the course of twenty-four hours shift to every point, but the most general direction is either north or south.—*Report of 1827.*]

OBSERVERS.

1827, (Rain gage only,) S. STRONG, Principal.	1843, (Ex. rain gage,) G. BRAINARD, Principal and ALBERT MANDELL
1830, '1, '2, '4, SALEM TOWN, Principal.	1844, GEORGE B. GLENDENING, A. M., Principal.
1838, (Ex. rain gage,) LEWIS BIXBY, Principal.	1845, (Ex. rain gage,) G. B. GLENDENING and CHARLES G. BRUNDIGE, Principals.
1840, do G. W. SCHENOK and J. T. FOSTER, Principals.	1846, do C. G. BRUNDIGE, Principal, and ALBERT MANDELL
1841, do not stated.	1850, MARY G. LAWRENCE.
1842, do EDWARD COOPER, Principal.

SUMMARY OF OBSERVATIONS AT CHERRY VALLEY ACADEMY,

CHERRY VALLEY, OTSEGO COUNTY, N. Y., DURING 15 YEARS.

Latitude N. 42° 48'; Longitude W. 74° 47'. Elevation above tide, 1335 feet. In an elevated valley, open to the south, on the height of land which divides the tributary waters of the Susquehanna from those of the Mohawk. Surrounding country broken and hilly.

OBSERVERS.

1827 to 1831, Dr. WILLIAM CAMPBELL.
 1832, WILLIAM CAMPBELL and PETER MAGNER, Trustees.
 1833, WILLIAM CAMPBELL, a Trustee.
 1834, 5, Rev. JOHN SMITH, Principal.
 1836, Rev. JOHN SMITH and CHARLES KILBOURN, Principals.

1841, Hon. WILLIAM CAMPBELL and J. H. CARRUTH.
 1842, 3, G. WASHINGTON TAYLOR, Principal, and Wm. CAMPBELL, Esq.
 1844, G. W. TAYLOR, Principal, Hon. Wm. CAMPBELL and JAMES H. CARRUTH, A. M.
 1845, JAMES H. CARRUTH, Principal.

Highest degree, July 26, 1834, - - - - - 98°
 Lowest degree, January 7, 1835, and February 5, 1836, - - - - - 30°
 Extreme range in 13 years, - - - - - 123
 Greatest monthly range in January.
 Total fall of rain and snow in 14 years, 47 feet 10,51 inches.

Least monthly range in July.
 Mean monthly range, 73°
 Driest month, February.
 Wettest month, June.

OBSERVATIONS AT CHERRY VALLEY ACADEMY.

SUMMARY OF OBSERVATIONS AT CORTLAND ACADEMY,

HOMER, CORTLAND COUNTY, N. Y., DURING 18 YEARS.

Latitude N. 42° 38'; Longitude W. 76° 11'. Elevation above tide, 1096 feet. In the valley of the Homer river, 98 feet below the Tully lakes.

[“Homer village is situated in a long and somewhat deep valley, producing a fluctuation and uncertainty in the currents of air which do not exist on the high land around.”]—*Report of 1829.*

OBSERVERS.

1832, SAMUEL B. WOOLWORTE, Principal, and GEO. W. BRADFORD, M. D.

1833, 1855 to 1850, inclusive, GEORGE W. BRADFORD, M. D.

(Rain gage not observed at this station.)

Highest degree, June 22, 1849, and July 13, 1845, — 102°
 Lowest degree, December 16, 1835, — 22
 Extreme range in 16 years, — 124
 Greatest monthly range in April.
 Least monthly range in July.

Mean monthly range, 73°.
 Driest month, February.
 Wettest month, August.
 Total fall of rain and snow in 14 years, 44 feet, 6,36 inches.

SUMMARY OF OBSERVATIONS AT ERASMUS HALL,

FLATBUSH, KINGS COUNTY, N. Y., DURING 24 YEARS.

Latitude N. 40° 37'; Longitude W. 73° 58'. Elevation above tide, 40 feet. "On an inclined plane gradually descending to the ocean, near the western extremity of Long Island."

OBSERVERS.

1826, J. C. KIDDER.
 1827, '8, JONATHAN B. KIDDER.
 1829, J. W. KELLOGG and J. B. KIDDER.
 1830, J. W. KELLOGG, Principal, and Wm. ALLGEO.
 1831, '2, '3, J. W. KELLOGG, Principal.
 1834, Wm. H. CAMPBELL, Principal, and J. W. KELLOGG.

1835, Wm. H. CAMPBELL, Principal.
 1836, Rev. THOMAS M. STRONG and Wm. H. CAMPBELL, Principals.
 1837, Wm. H. CAMPBELL, Principal, and Rev. T. M. STRONG, Trustee.
 1838, Rev. T. M. STRONG, Trustee, and WILLIAM H. CAMPBELL, Principal.
 1839 to 1849, inclusive, Rev. THOMAS M. STRONG, Trustee.

SUMMARY OF OBSERVATIONS AT FAIRFIELD ACADEMY,

FAIRFIELD, HERKIMER COUNTY, N. Y., DURING 19 YEARS.

Latitude N. 43° 05'; Longitude W. 74° 55'. Elevation above tide, 1185 feet. About 300 feet above the valley of West Canada Creek, and 800 feet above the Erie Canal at Herkimer.

OBSERVERS.

1827, L. BARROWS and THOS. GORTON, Students.
 1828, J. J. H. KINNICUT and DAVID CHASSELL, Jun.
 1831, DAVID CHASSELL, Jun.
 1832, D. CHASSELL and J. E. CHASSELL.
 1833, J. E. CHASSELL.
 1835, DAVID CHASSELL, Jun.

1836, DAVID CHASSELL, Principal, and D. CHASSELL, Jun.
 1837, J. E. CHASSELL.
 1838, '9, J. E. CHASSELL.
 1840, O. BLANCHARD, Teacher, and others.
 1841, ORLANDO BLANCHARD, Teacher.
 1848, '9, LINUS E. FORD, Trustee.

Highest degree, August 23, 1839, - 96°
 Lowest degree, December 17, 1835, - 26°
 Extreme range in 19 years, - 70°
 Greatest monthly range in December.
 Least monthly range in July.

Mean monthly range, 72°.
 Driest month, February.
 Wettest month, June.
 Total fall of rain and snow in 17 years, 51 feet 10,24 inches.

SUMMARY OF OBSERVATIONS AT FARMERS' HALL,

GOSHEN, ORANGE COUNTY, N. Y., DURING 11 YEARS.

Latitude N. 41° 20'; Longitude W. 74° 11'. Elevation above tide, 425 feet, as ascertained by the recent railroad survey.

"The thermometer used was made by B. Pike N. Y., exposed to a full current of air, and not to reflected heat. The thermometer used for several of the first years, was broken. Latterly the thermometer was hung on the outside casing of a door. The evening observations usually taken at 9 P. M.

"The rain gage was kept elevated four feet from the ground, and was of the conical kind. Goshen village is situated in a valley, about three-quarters of a mile wide, running S. W. and N. E. The Walkill, a small river, runs N. W. about 4 miles. It is about 20 miles from the Hudson. No lakes, sandy plains, forests or mountains nearer than four or six miles. The surface is generally rolling, and the prevailing direction of the valleys from N. E. to S. W."—Dr. JOHN S. CRANE, *President of Trustees, in a letter to the Editor.*

OBSERVERS.

1835, NATHAN STARK, Principal.

1838, NATHANIEL WEBB, Principal, and others.

1839 to 1842, N. WEBB, Principal, and Dr. JOHN S. CRANE, Trustee.

1844, JOHN S. CRANE, Trustee.

1845, '6, HENRY FITCH, Principal.

1847, JOHN S. CRANE and N. WEBB, Trustees.

1849, JOHN S. CRANE, Trustee.

SUMMARY OF OBSERVATIONS AT FRANKLIN ACADEMY,

MALONE, FRANKLIN COUNTY, N. Y., DURING THREE YEARS.

Latitude N. 44° 50'; Longitude W. 74° 23'. Elevation above tide, 703 feet.

OBSERVERS.

1839, LORENZO COBURN, Principal, and others.
1840, WERDEN REYNOLDS, Associate Principal.

1842, ELOS L. WINSLOW, Principal.

Highest degree, July 17, 1840, and August 22, 1840 - - - - - 94°
 Lowest degree, January 16, 1840, - - - - - -24
 Extreme range in 3 years, - - - - - - - - - -118
 Greatest monthly range in February.
 Least monthly range in August and October.

Mean monthly range, 65°.
 Driest month, November.
 Wettest month, July.
 Total fall of rain and snow in 3 years, 7 feet 8,21 inches.

SUMMARY OF OBSERVATIONS AT FRANKLIN ACADEMY,

PRATTSBURGH, STEUBEN COUNTY, N. Y., DURING TEN YEARS.

Latitude N. 42° 34'; Longitude W. 77° 20'. Elevation above tide, 1494 feet. On a branch of the Chemung river, elevated above Crooked lake 776 feet.

OBSERVERS.

1829, ELY EDDY, ROBERT PORTER and SEYMOUR GOOKIN.
1830, SEYMOUR GOOKIN, Principal, and A. H. STORRS.

1839, to 1845 inclusive, FLAVEL S. GAYLORD, Principal.
1846, CURTIS C. BALDWIN, late Principal.

SUMMARY OF OBSERVATIONS AT FREDONIA ACADEMY,

FREDONIA, CHAUTAUQUE COUNTY, N. Y., DURING EIGHTEEN YEARS.

Latitude N. 42° 26'; Longitude W. 79° 24'. On the east side of Canadaway creek, on a flat about 144 feet above Lake Erie, distant 2½ miles from the lake. On the southeast, the highlands of Chautauque are distant seven miles.

OBSERVERS.

1830, J. ADDISON EASTMAN, Principal.	1836, HENRY CHANEY, Principal.
1831, HENRY CHANEY and J. A. EASTMAN, Principals.	1836 '7, HENRY CHANEY, Principal, and Miss ISABELLA J. CARYL
1832, HENRY CHANEY, Principal.	1838 to 1843, inclusive, CHARLES H. PALMER, Principal.
1834, DANIEL STEWART, JOHN CRANE and HENRY CHANEY.	1844 to 1848, inclusive, F. A. REDINGTON, Principal.

SUMMARY OF OBSERVATIONS AT GOUVERNEUR WESLEYAN SEMINARY,

GOUVERNEUR, ST. LAWRENCE COUNTY, N. Y., DURING TWELVE YEARS.

Latitude N. 44° 25'; Longitude W. 75° 35'. Elevation above tide, 400 feet; on the north side of the Oswegatchie river. The soil around the academy is a light sandy loam. There are no hills or highlands in the immediate vicinity, likely to influence the direction of the winds. The general direction of the valleys and the primary ridges in the neighborhood corresponds with that of the river St. Lawrence, and with the prevailing winds.

OBSERVERS.

1831 '2, JOSEPH HOPKINS, Principal.	1841, ERASTUS WENTWORTH and D. R. WRIGHT.
1833 '4, JOSEPH HOPKINS, Principal, and J. H. TYLER.	1842, D. R. WRIGHT, Teacher, and WM. D. CUMMINGS, Student.
1835, JESSE H. TYLER, ERWIN H. BARNES and ANDREW J. HAILE.	1843, H. D. LANDY, A. M., Professor, and WM. D. CUMMINGS, Student.
1836, 1838, ERWIN H. BARNES, Student.	1844 '5, H. D. LANDY, A. M., Professor.
1839, DEXTER R. WRIGHT and JUSTIN T. ALDEN, Students.

SUMMARY OF OBSERVATIONS AT GRANVILLE ACADEMY,

NORTH GRANVILLE, WASHINGTON COUNTY, N. Y., DURING FOURTEEN YEARS.

Latitude N. 44° 20'; Longitude W. 73° 17'.

Kendall's thermometer was used at this station, which, being twice broken, was replaced by one made by Barrett, of London. The rain gage was the common one, with cylinder and floats, furnished by the Regents. It was placed on a level with the ground.

A river runs about 100 rods westerly, north of the academy, which is on a plain of gravelly soil, and some 75 or 100 feet above the river. On the south, the ground gradually rises for 60 or 80 rods; and southwesterly, at the distance of half a mile, the surface is more hilly.—JOHN C. PARKER, *in a letter to the Editor.*

OBSERVERS.

1835, JOHN C. PARKER, Trustee.

1846 to 1849, inclusive, JOHN C. PARKER, Esq., a Trustee.

1836 to 1845, except 1837, E. T. MACK, Principal.

SUMMARY OF OBSERVATIONS AT HAMILTON ACADEMY,

HAMILTON, MADISON COUNTY, N. Y., DURING 18 YEARS.

Latitude N. 42° 49'; Longitude W. 75° 34'. Elevation above tide, 1127 feet. In a valley of a branch of the Chenango,
702 feet above the canal at Utica.

"Hamilton Academy is situated in a valley, 23 miles from Utica, and about 700 feet above the Erie canal, at that place. A branch of the Chenango river enters the village from the northwest, thence runs southwest; and the winds, following the course of the river, are for the most part, in those directions."—
Report of 1828.

OBSERVERS.

1827, '8, '9, ZENAS MORSE, Principal.	1839, HAMILTON MILES and O. HARRINGTON, Teachers.
1830, ZENAS MORSE, Principal, and N. BISHOP, Teacher.	1842, L. M. PECK and T. C. BURROUGHS, Teachers.
1831, NATHAN BISHOP, Assistant Teacher.	1843, L. C. YORK and J. C. BURROUGHS, Teachers.
1833, ZENAS MORSE, Principal, and A. WHITE.	1844, ZENAS MORSE, Principal, and L. C. YORK, Teacher.
1834, ZENAS MORSE, Principal, A. WHITE and M. C. KENDRICK.	1845, ZENAS MORSE, Principal, MONROE WEED and B. F. ADAMS, Teachers.
1835, ZENAS MORSE and ALVIN LATHROP, Principals.	1847, '8, '9, MONROE WEED, Principal.
1836, ALVIN LATHROP and JOSHUA PHELPS, Principals.

Highest degree, July 28, 1843, - - - - - 96°
 Lowest degree, January 7, 1835, - - - - - -34
 Extreme range in 18 years, - - - - - 130
 Greatest monthly range in January.
 Least monthly range in August.

Mean monthly range, 77½°.
 Driest month, April.
 Wettest month, July.
 Total fall of rain and snow in 18 years, 51 feet 0,28 inches.

SUMMARY OF OBSERVATIONS AT HARTWICK SEMINARY,

HARTWICK, OTSEGO COUNTY, N. Y., DURING SEVENTEEN YEARS.

Latitude N. 42° 38'; Longitude W. 75° 01'. Elevation above tide, 1100 feet. On a tributary of the Susquehanna.

OBSERVERS.

1826, ERNEST L. HAZELIUS. 1839, Rev. GEORGE B. MILLER, Principal, and L. STERNBERG, Professor.
 1827, E. L. HAZELIUS, D. D., Prin., and G. B. MILLER, Prof. 1845, Rev. GEORGE B. MILLER, Principal.
 1828 to 1835, (ex. 1833, '4,) Rev. GEORGE B. MILLER, Prin. 1846 to 1850, inclusive, Rev. GEORGE B. MILLER, Principal.
 1837, L. STERNBERG, Assistant Teacher.

SUMMARY OF OBSERVATIONS AT ITHACA ACADEMY,

ITHACA, TOMPKINS COUNTY, N. Y., DURING 17 YEARS.

Mean temperature, 17 years; mean temperature of half months, winds and aspect of sky, 16 years; rain gage, 13 years.

Latitude N. 42° 27'; Longitude W. 76° 30'. Elevation above tide 417 feet. In a valley at the head of Cayuga lake, about 30 feet above the surface of the water.

OBSERVERS.

1827, (temperature only,) SAMUEL PHINNEY, Principal.	1810, '2, not stated.
1828, J. L. HENDRICKS, Principal.	1843, LATHROP WETHERELL, Prof., and ALFRED STEBBINS, Teacher.
1833, 1835, WILLIAM A. IRVING, Principal.	1844, '5, LATHROP WETHERELL, Professor.
1836, WILLIAM A. IRVING and JAMES F. COGSWELL, Principals.	1846, not stated.
1837, '8, JAMES F. COGSWELL, Principal.	1847, '8, LATHROP WETHERELL, Professor of Mathematics and
1839, WILLIAM S. BURT, Principal.	Natural Science.

SUMMARY OF OBSERVATIONS AT JOHNSTOWN ACADEMY,

JOHNSTOWN, FULTON COUNTY, N. Y., DURING FOURTEEN YEARS.

Latitude N. 43° 00'; Longitude W. 74° 23'. On the north side of the valley of the Mohawk.

Johnstown is situated on the Cayadutta creek, four miles north of the Mohawk river, at Fonda, and by a railroad survey, ascertained to be 688 feet above tide water at Troy. The surrounding country is undulating, and underlaid by Utica slate. The surface at the village slopes northward towards the creek that flows near it.

OBSERVERS.

1828, S. PHINNEY, Principal.	1837, 1838, PETER BURKE, Principal.
1829, XENOPHON HAYWOOD.	1841, HENRY S. BROWN and B. D. CRARY, Principals.
1831, WILLIAM MAXWELL.	1842, not stated.
1832, WILLIAM MAXWELL and ALEXANDER MURRAY, JUN.	1843, B. DENISON CRARY, Principal.
1834, ALBERT AMERMAN and JOHN G. SMART, Teachers.	1844, B. D. CRARY, Principal, and PETER BROOKS.
1835, J. G. SMART, REV. A. AMERMAN and P. BURKE, Principals.	1845, PETER BROOKS, Esq. and B. D. CRARY.
1836, PETER BURKE, Principal, and J. A. SAVAGE, Assistant.

Highest degree, July 21, 102°
 Lowest degree, January 16, 1840, -30
 Extreme range in 17 years - - - - - 132
 Greatest monthly range in January.
 Least monthly range in August.

Mean monthly range, 74°.
 Driest month, February.
 Wettest month, June.
 Total fall of rain and snow in 17 years, 51 feet 6.84 inches.

SUMMARY OF OBSERVATIONS AT KINGSTON ACADEMY,

KINGSTON, ULSTER COUNTY, N. Y., DURING TWENTY YEARS.

Latitude N. 41° 55'; Longitude W. 74° 02'. Elevation above tide 188 feet. On an extensive plain, 188 feet above the Hudson River, on the west side.

OBSERVERS.

1829, 1830, not stated. 1831, R. B. HUBBARD, Principal. 1832, C. S. VAN GAASBECK and H. HURLBUT. 1833, HENRY HURLBUT and R. B. HUBBARD. 1834, R. B. HUBBARD and I. A. BLAUVELT, Principals. 1835 to 1840, inclusive, ISAAC A. BLAUVELT, Principal.	1841, not stated. 1842, CHARLES L. HUNGERFORD and J. NICHOLS. 1843, CHARLES L. HUNGERFORD, Principal. 1845, '6, '7, FRANCIS H. WELLS, Principal. 1848, '9, WILLIAM MCGEORGE, Principal.

Highest degree, July 13, 1845. - - - - - 100°
 Lowest degree, January 4, 1835, - - - - - 30
 Extreme range in 20 years, - - - - - 70
 Greatest monthly range in January.
 Least monthly range in July and August.

Mean monthly range, 71°.
 Driest month, February.
 Wettest month, July.
 Total fall of rain and snow in 19 years, 59 feet 5.01 inches.

OBSERVATIONS AT KINGSTON ACADEMY.

SUMMARY OF OBSERVATIONS AT LANSINGBURGH ACADEMY,

LANSINGBURGH, RENSSELAER COUNTY, N. Y., DURING TWENTY YEARS.

Latitude N. 42° 47'; Longitude W. 73° 40'. Elevation above tide 30 feet. In the valley of the Hudson, on the east side of the river.

OBSERVERS.

1826, HORATIO GATES SPAFFORD.

1827 to 1833, inclusive, ALEXANDER MCCALL, Principal.

1834, E. B. JANES, Teacher, and W. H. HADLEY, Principal.

1835, W. H. HADLEY and E. B. JANES, Principals.

1836, E. B. JANES, Principal, and P. L. WHIPPLE, Trustee.

1837, Rev. P. L. WHIPPLE, Trustee.

1839, E. G. FOOTE, Teacher.

1840, 1841, H. WHITE, Teacher.

1842, '3, '4, '5, EBENEZER D. MALTBIE, Principal, and others.

1846, E. D. MALTBIE and C. G. PEASE, Principals.

1847, CLARK G. PEASE, Principal.

1850, CYRUS BOLSTER.

SUMMARY OF OBSERVATIONS AT LEWISTON HIGH SCHOOL ACADEMY,

LEWISTON, NIAGARA COUNTY, N. Y., DURING 18 YEARS.

Rain gage 13 years. Mean temp. of separate halves of months in the year 1839, not given.

Latitude N. 43° 09'; Longitude W. 79° 10'. Elevation above tide 280 feet. On the eastern bank of the Niagara River, near Lake Ontario.

OBSERVERS.

1831, JACOB HOOKE QUINBY, Principal.
 1832, '3, SULLIVAN CAVERNO, Principal.
 1834, SHERBURNE B. PIPER, Principal.
 1835, '6, '7, M. H. FITTS, Principal.
 1839, Not stated. (results of temp. only given.)
 1840, Not stated.
 1841, M. H. FITTS, Principal.
 1842, R. E. LANE and THOMAS S. RUSSELL, Teachers

1843, ex. Rain gage. M. H. FITTS Principal, and THOMAS S. RUSSELL, Teacher.
 1844, '5, ex. Rain gage. M. H. FITTS, Principal.
 1846, M. H. FITTS, Principal.
 1847, ex. Rain gage. M. H. FITTS, Principal.
 1848, JONATHAN BELL, Esq., Trustee, and B. BACHELLER, Principal.
 1849, JONATHAN BELL, Esq., a Trustee.

 Lowest degree, February 23, 1832, and January 2, 1837, - - - - - -6
 Extreme range in 17 years, - - - - - 103
 Greatest monthly range in March.
 Least monthly range in July.

Mean monthly range, 65°.
 Driest months, February and December.
 Wettest month, October.
 Total fall of rain and snow in 13 years, 24 feet 5,99 inches.

SUMMARY OF OBSERVATIONS AT LOWVILLE ACADEMY,

LOWVILLE, LEWIS COUNTY, N. Y., DURING NINETEEN YEARS.

Latitude N. 43° 47'; Longitude W. 75° 33'. Elevation above tide 800 feet. In the valley of a branch of Black River, about 100 feet above the level of the river.

This Academy is situated in a valley surrounded on the north, west and south by elevated table lands. To the west, and running nearly parallel with the Black river, is an elevated range of table land, rising in some places to an elevation of more than a thousand feet above the level of the river. Until recently this has been covered with the native growth of timber.

OBSERVERS.

1827, '8, '9, '30, STEPHEN W. TAYLOR.
1831, STEPHEN W. TAYLOR, Principal, and E. E. BARNEY.
1832, E. E. BARNEY, Principal.
1833, CYRUS M. FAY, Principal.
1835, HENRY MALTBY, Principal.

1837, E. WENTWORTH, Principal, and H. BANNISTER.
1839, '40, D. P. MAYHEW, Associate Principal.
1841, '2, '3, '4, D. P. MAYHEW, Principal.
1845, D. P. MAYHEW, Principal, and M. A. AVERY.
1846, '7, '8, D. P. MAYHEW, Principal.

Highest degree, July 13, 1942, - - - - - 100°
 Lowest degree, December 17, 1835, - - - - - 40
 Extreme range in 19 years, - - - - - 140
 Greatest monthly range in December.
 Least monthly range in July and August.

Mean monthly range, 79°.
 Driest month, March.
 Wettest month, July.
 Total fall of rain and snow in 18 years, 47 feet 10,56 inches.

SUMMARY OF OBSERVATIONS AT MIDDLEBURY ACADEMY,

MIDDLEBURY, WYOMING COUNTY, N. Y., DURING EIGHTEEN YEARS.

Mean temp. of months and comparison of warm and cold days 19 years. All other observations 18 years, except Rain gage 17 years.

Latitude N. 42° 49'; Longitude W. 78° 10'. Elevation above tide 800 feet. In the valley of Allen's creek, a tributary of the Genesee river, estimated to be from 200 to 300 feet above the canal at Rochester.

OBSERVERS.

1826 to 1835, inclusive, SETH CUSHING, Jr., Teacher.
1839, (except Rain gage,) Not stated.
1840, A. A. HOWARD and R. H. PADDOCK, Teachers.
1841, Whole year, DANIEL C. HOUGHTON.
1842, DANIEL C. HOUGHTON and ALBERT B. CAPWELL, Teachers.

1843, A. B. CAPWELL, Principal.
1844, '5, JOEL WHITING, Principal.
1846, (Results of thermometer and comparative tables only given,) JOEL WHITING, late Principal.
1848, R. K. SANFORD and DAVID BURBANK.

SUMMARY OF OBSERVATIONS AT MILLVILLE ACADEMY,

MILLVILLE, ORLEANS COUNTY, N. Y., DURING EIGHT YEARS.

Latitude N. 43° 08'; Longitude W. 78° 20'.

OBSERVERS.

1840, '1, (except Rain gage.) JAMES F. COGSWELL, Principal.
1842, '3, '4, JAMES F. COGSWELL, Principal.
1845, SAMUEL W. POPE and J. F. COGSWELL, Principals.

1846, SAMUEL W. POPE, Principal.
1847, ROSWELL BROOKS, Principal, S. W. POPE, late Principal,
and Dr. A. M. FROST, Trustee.

SUMMARY OF OBSERVATIONS AT MONROE ACADEMY,

HENRIETTA, MONROE COUNTY, N. Y., DURING THREE YEARS.

Latitude N. 48° 06', Longitude W. 77° 51'. Elevation above tide 600 feet. Seven miles south of Rochester.

OBSERVERS.

1835, '6, J. SMITH WHITAKER, Principal.

1839, (except Rain gage,) E. D. RANSOM, Principal.

Highest degree, June 10, 1835, - - - - - 96°
 Lowest degree, February 4, 1836, - - - - - 9°
 Extreme range in 3 years, - - - - - 105°
 Greatest monthly range in February.
 Least monthly range in July.

Mean monthly range, 60°.
 Driest month, December.
 Wettest month, October.
 Total fall of rain and snow in 2 years, 4 feet 5,61 inches.

Highest degree, July 20, 1839, - 104°
 Lowest degree, January 4, 1835, - 33°
 Extreme range in 13 years, - 71°
 Greatest monthly range in January.
 Least monthly range in August.

Mean monthly range, 77½°.
 Driest month, February.
 Wettest month, June.
 Total fall of rain and snow in 13 years, 37 feet 10,13 inches.

SUMMARY OF OBSERVATIONS AT MOUNT PLEASANT ACADEMY,

MOUNT PLEASANT, WESTCHESTER COUNTY, N. Y., DURING TWELVE YEARS.

Latitude N. 41° 09'; Longitude W. 73° 47'. Elevation above tide 125 feet. On the east side of the valley of the Hudson,
125 feet above its level.

OBSERVERS.

1831, SAMUEL I. PRIME, Assistant Teacher.
1832, S. I. and E. D. G. PRIME, Teachers.
1834, EDWARD D. G. PRIME, Teacher.
1835, ALBERT WELLS, Principal, and E. D. G. PRIME, Teacher.
1837, ALBERT WELLS, Principal, and E. WELLS, Teacher.

1838, ALBERT WELLS, Principal.
1839, N. H. WELLS, Teacher.
1840, '41, ALBERT WELLS, Principal, and Rev. N. H. WELLS.
1842, ALBERT WELLS and MARLBOROUGH CHURCHILL, Principals.
1843, '44, MARLBOROUGH CHURCHILL, Principal.

SUMMARY OF OBSERVATIONS

AT THE

NEW-YORK INSTITUTION FOR THE DEAF AND DUMB,

NEW-YORK CITY, DURING FIVE YEARS.

Temperature of months, 6 years; winds, weather and temperature of halos of months, 5 years; rain gage, 3 years;
mean temperature, 6 years.

Latitude N. 42° 45'; Longitude W. 74° 02'.

[Thermometer by B. Pike & Son, N. Y., replaced several times. The rain gage used was the conical one. During a part of the time, observations were made at five feet and at eighty-five feet above the ground with the following results: total at 85 feet from the ground, from February, 1845, to July 15, 1846, 44,687. During same period at 5 feet, 60,232. Excess of the latter 15,545. Prof. O. W. MORRIS.]

OBSERVER.

1844 to 1850, except 1845, Prof. ORAN W. MORRIS.

SUMMARY OF OBSERVATIONS AT NORTH SALEM ACADEMY,

NORTH SALEM, WESTCHESTER COUNTY, N. Y., DURING NINETEEN YEARS.

Latitude N. 41° 26', Longitude W. 73° 33'.

[Situated on the N. bank of the river Titicus, a tributary of Croton river, about 20 miles from Peekskill, 361,39 feet above tide, as determined very accurately by recent railroad surveys. The valley of the Titicus is from a half mile to a mile and a half wide, and is bordered by hills a hundred to three hundred feet in height. These are often rocky, containing rocks of micaceous granite, and in several places coarsely crystalline limestone crops out and crosses the valley. Near the Academy the valley extends from N. W. to S. E., but is so wide that the winds must be slightly if at all modified by it. The thermometer, in use in 1840-42, was by Pike of N. Y. This was then replaced by one purchased of Roach and Warner of N. Y., which is half a degree above the standard now used. It was placed outside of a second story window, on the north side of the Academy, protected from the morning sun in summer. In the afternoon several observations were made between 1 and 4, and highest recorded. In the evening it was observed at 9. The conical rain gage was used, at an elevation of 5 feet from the ground, on a post and at a distance from the building. No change was made in these arrangements during the last 10 years. JOHN F. JENKINS.]

OBSERVERS.

1829, (except Rain gage.) Rev. HIRAM TELLIFF, Principal.
1830, '31, '32, '33, Rev. HIRAM TELLIFF, Principal.
1834, H. TELLIFF and JOHN C. JONES, Principals.
1835, JOHN C. JONES, Principal.
1838, WILLIAM S. TOZER, Principal.
1840, JOHN F. JENKINS, Principal.

SUMMARY OF OBSERVATIONS AT OGDENSBURGH ACADEMY

OGDENSBURGH, ST. LAWRENCE, COUNTY, N. Y., DURING ONE YEAR.

Latitude N. 44° 43'.

[The rain gage used was of delicate construction, the water being weighed instead of measured. The snow was also weighed instead of measured. The thermometer was swung briskly in the open air before an observation was made, whenever there was any reason to doubt its accuracy. It was of Kendall's manufacture, New Lebanon. The Academy at Ogdensburgh is on a plain, elevated about forty feet above the Oswegatchie, and near its entrance into the St. Lawrence. There are no hills or mountains within sight which could influence the course of winds, which partske of the general direction of the valley of the St. Lawrence. The winds were recorded by a self-registering apparatus that denoted the length of time which they prevailed, by night as well as by day. JAMES H. COFFIN.]

OBSERVER.

1838, JAMES H. COFFIN, Principal.

SUMMARY OF

OBSERVATIONS AT ONEIDA CONFERENCE SEMINARY,

CAZENOVIA, MADISON COUNTY, N. Y., DURING EIGHTEEN YEARS. (RAIN GAGE NINETEEN YEARS.)

Latitude N. 42° 55'; Longitude W. 75° 46'. Elevation above tide 260 feet, and above canal at Utica 824 feet.

OBSERVERS.

1830, AUGUSTUS W. SMITH, Principal.

1831, J. W. TYLER and A. W. SMITH, Principala.

1832, J. W. TYLER and J. JOHNSTON, Teachers.

1833, JOHN JOHNSTON, Teacher.

1834, JOHN JOHNSTON, Professor of Mathematics, &c.

1835, Not stated.

1836, ORLANDO BLANCHARD.

1837, Not stated.

1838, '39, O. BLANCHARD, Teacher.

1840, ORLANDO BLANCHARD and GEO. W. HIND, Teachers.

1841, '42, '43, '44, HORATIO R. CLARKE, Professor Nat. Science.

1845, HORATIO R. CLARKE and EDWARD BANNISTER.

1846, '47, '48, '49, EDWARD BANNISTER, Professor.

Highest degree, July 4, 1838, - - - - - 97°
 Lowest degree, January 1, 1840, - - - - - 28°
 Extreme range in 19 years, - - - - - 69°
 Greatest monthly range in March.
 Least monthly range in July and August.

Mean monthly range, 74°.
 Driest month, February.
 Wettest month, June.
 Total fall of rain and snow in 19 years, 61 feet 3,86 inches.

OBSERVATIONS AT ONEIDA CONFERENCE SEMINARY.

SUMMARY OF OBSERVATIONS

AT THE

ONEIDA INSTITUTE OF SCIENCE AND INDUSTRY,

WHITESTOWN, ONEIDA COUNTY, N. Y., DURING SEVEN YEARS.

Latitude N. 43° 08'; Longitude W. 75° 14'. Valley of the Mohawk, on the same level as the canal.

OBSERVERS.

1834, ISAAC T. PLATT.	1837, JOSEPH CANFIELD.
1835, ISAAC S. PLATT.	1838, GEORGE GEMEL, Student.
1836, J. JUDD.	1839, '40, Not stated.

SUMMARY OF OBSERVATIONS AT ONONDAGA ACADEMY,

ONONDAGA HOLLOW, ONONDAGA COUNTY, N. Y., DURING SIXTEEN YEARS.

Latitude N. 42° 59'; Longitude W. 76° 06'. On the west side of Onondaga creek, in Onondaga valley, about 50 rods from the same, and 20 feet above the level of its banks.

OBSERVERS.

1826, '27, '28, SAMUEL B. WOOLWORTH, Principal.
1829, S. B. WOOLWORTH, Principal, R. DICKINSON and M. MARSH.

1832 to 1844, except 1834, J. L. HENDRICK, Principal.

SUMMARY OF OBSERVATIONS AT OXFORD ACADEMY,

OXFORD, CHENANGO COUNTY, N. Y., DURING SEVENTEEN YEARS.

Latitude N. 42° 28'; Longitude W. 75° 32'. Elevation above tide 961 feet. In the valley of the Chenango river.

OBSERVERS.

1829, '30, '31, WILLIAM D. BEATTIE, Principal.

1832, M. G. and S. McKoon, Principals.

1833, M. G. McKoon, Principal, and SAMUEL McKoon.

1834 to 1841, inclusive, MERRITT G. McKoon, Principal.

1842, MERRITT G. McKoon, Principal, and WILLIAM H. HYDE, Student.

1843, '44, '45, WILLIAM H. HYDE, Teacher.

Highest degree, June 7, 1829.
 Lowest degree, January 24, 1836.
 Extreme range in 17 years, - - -
 Greatest monthly range in January.
 Least monthly range in July.

98°
 —36
 134

Mean monthly range, 76°.
 Driest month, February.
 Wettest month, June.
 Total fall of rain and snow in 17 years, 51 feet 1,12 inches.

SUMMARY OF OBSERVATIONS AT PLATTSBURGH ACADEMY,

PLATTSBURGH, CLINTON COUNTY, N. Y., DURING FIVE YEARS.

Latitude N. 44° 42'; Longitude W. 73° 76'

[The thermometer used, was of Loudon manufacture, name of maker not given. It was some 3° higher than the one now used. It was hung on a column of a piazza, on the NE. side, since 1846 The Rain gage was the one with floating rod, elevated 5 feet from the ground. Plattsburgh is situated at the mouth of the river Saranac; the nearest mountains and considerable hills being some twenty miles distant. J. S. D. TAYLOR.]

OBSERVERS.

1841, (ex. rain gage,) JOSEPH SCOTT and A. M. FOSTER, Principals.
1842, (ex. rain gage,) A. M. FOSTER, Principal.

1847, JOHN D. S. TAYLOR, Principal.
1848, '49, JOSEPH W. TAYLOR, Teacher.

SUMMARY OF OBSERVATIONS AT POMPEY ACADEMY,

POMPEY, ONONDAGA COUNTY, N. Y., DURING SEVENTEEN YEARS.

Latitude N. 42° 56'; Longitude W. 76° 05'. One of the highest points of land in the county, not less than 900 feet above the canal at Salina. Elevation above tide 1300 feet.

OBSERVERS.

1826, (except rain gage,) Not stated.

1827, HENRY HOWE, Instructor, and E. S. BARROWS.

1828, E. S. BARROWS, Principal, H. HOWE, Instructor, and A. HUNTINGTON.

1829, ANDREW HUNTINGTON, Principal.

1830, ANDREW HUNTINGTON, a Teacher.

1831, (except rain gage,) ANDREW HUNTINGTON, Principal.

1832, '33, ANDREW HUNTINGTON, Principal.

1835 to 1842, inclusive, SAMUEL S. STEBBINS, Principal.

1843, SAMUEL S. STEBBINS and ENSIGN BAKER, Principals.

SUMMARY OF OBSERVATIONS AT REDHOOK ACADEMY,

REDHOOK, DUTCHESS COUNTY, N. Y., DURING TWELVE YEARS.

Latitude N. 42° 02'; Longitude W. 73° 56'. On the east side of the valley of the Hudson, in the village of Upper Redhook.

OBSERVERS.

1830 to 1833, inclusive, LYMAN THOMPSON, Principal.	1839, GEO. W. SCHENCK, Principal.
1834, (except rain gage,) JOHN HALL, Principal.	1840, G. W. SCHENCK and R. W. SMITH, Principals, and E. M. SMITH, Student.
1835, (except rain gage,) J. O. NORTON, Principal.	1841, ROBERT W. SMITH, Principal.
1836, STEPHEN REED, Principal, J. O. NORTON and L. C. HOLCOMB.	1842, OVEL COOK, Jr., Principal, and DAVID E. SMITH, Student.
1837, STEPHEN REED, Principal.

SUMMARY OF OBSERVATIONS AT ROCHESTER COLLEGIATE INSTITUTE,

ROCHESTER, MONROE COUNTY, N. Y., DURING NINETEEN YEARS.

Latitude N. 43° 07'; Longitude W. 75° 51'. Elevation above tide 506 feet. On the Genesee river.

[The country around this station is a rolling level, with no local obstructions which might influence the direction of the winds. Lake Ontario is 5 miles to the north, and there are slight hills to the south which have no influence upon the winds. The surface winds are observed to differ from the upper currents. From 1836 till about 1844, the indications of the wind vane were recorded, but subsequently the direction as shown by clouds. This difference has been ascribed to the fact that the waters of Lake Ontario acquire and retain, till late, the summer's heat, and thus give a tendency of the surface current of air towards them. The thermometer was suspended on the north side of a building, not exposed to reflections, and having a grass plat around it. The common rain gage, with hollow bulb and floating rod, was used; it was 6 feet from the ground. Prof. C. DEWEY.]

OBSERVERS.

Highest degree, July 29, 1833. - - - 96°
 Lowest degree, January 16, 1840. - - - -34
 Extreme range in 21 years. - - - -130
 Greatest monthly range in March.
 Least monthly range in July.

Mean monthly range, 73°.
 Driest month, February.
 Wettest month, July.
 Total fall of rain and snow in 20 years. 47 feet 9,50 inches.

SUMMARY OF OBSERVATIONS AT SCHENECTADY ACADEMY,

SCHENECTADY, SCHENECTADY COUNTY, N. Y., DURING THREE YEARS.

Latitude N. 42° 48'; Longitude W. 73° 55'.

OBSERVERS.

1829, DANIEL FULLER, Principal.
1836, ASA SHELDON.

1837, GILES F. YATES, Trustee, and Mr. SHELDON.
(Rain gage excepted.)

SUMMARY OF OBSERVATIONS AT SPRINGVILLE ACADEMY,

SPRINGVILLE, ERIE COUNTY, N. Y., DURING EIGHT YEARS.

Latitude N. 42° 30'; Longitude W. 78° 50'. Elevation supposed to be about 500 feet above the canal at Buffalo.

OBSERVERS.

1834, Not stated. (Wind not recorded.)
 1835, L. PARSONS, Principal, A. C. LAKE and C. A. PARSONS.
 (Temperature not recorded the whole year.)
 1839, (ex. rain gage,) EDWIN E. WILLIAMS, Principal, and JACOB LUTWELLER.

1842, '43, (ex. rain gage,) ALEX. C. HEUSTIS, Principal
 1847, '49, (ex. rain gage,) T. W. EARLE, Principal
 1850, (ex. rain gage,) MOSES LANE.

SUMMARY OF OBSERVATIONS AT UNION HALL,

JAMAICA, QUEENS COUNTY, N. Y., DURING TWENTY-FIVE YEARS.

Latitude N. 40° 41'; Longitude W. 73° 56'.

OBSERVERS.

1826, Dr. T. BLATCHFORD and PIRREPONT POTTER.
 1827 to 1832, inclusive, PIRREPONT POTTER.
 1833, P. POTTER, H. ONDERDONK and CHARLES LEACH.
 1834 to 1839, inclusive, CHARLES LEACH, Teacher.
 1840, CHA'S LEACH, CHA'S WATROUS and A. GUNN.
 1841, Not stated.

1842, THOMAS H. KELSEY, Teacher, and JOHN A. GUNN.
 1843 to 1847, inclusive, THOMAS H. KELSEY, Teacher.
 1848, GEORGE VANDERVEY, JR.
 1849, JOHN H. BRINCKERHOFF, Associate Principal.
 1850, JACOB H. AIKEN.

Highest degree, July 24, 1830, - - - - - 100°
 Lowest degree, January 11, 1849, and February 2, 1836, - - - - - 7°
 Extreme range in 25 years, - - - - - 107°
 Greatest monthly range in January.
 Least monthly range in August.

Mean monthly range, 64½°.
 Driest month, February.
 Wettest month, August.
 Total fall of rain and snow in 25 years, 81 feet 7,19 inches.

SUMMARY OF OBSERVATIONS AT UNION LITERARY SOCIETY,

BELLEVILLE, (ELLISBURGH,) JEFFERSON COUNTY, N. Y., DURING NINE YEARS.

Latitude N. 43° 45'; Longitude W. 76° 10'. Near the eastern shore of Lake Ontario.

OBSERVERS.

1830, ALVIN NINES, a Student.
1831, JOHN R. GROUT.
1833, JOHN W. SARGENT.
1834, J. W. SARGENT, J. B. COOK and L. G. PARKER, Students.
1835, H. H. BARNEY, Prin'l, L. G. PARKER and D. W. LITTLEFIELD.

1836, LYMAN E. BOOMER, Principal.
1842, GEO. J. KING, Principal, and D. ALONZO KING, Student.
1843, GEO. J. KING and RICHARD ELLIS, Principals, and others.
1844, ORASMUS COLE.

Highest degree, June 27, 1823, -
 Lowest degree, February 5, 1836,
 Extreme range in 22 years, -
 Greatest monthly range in January,
 Least monthly range in July.

Mean monthly range, 75°.
 Driest month, February.
 Wettest month, June.
 Total fall of rain and snow in 19 years, 60 feet 9,33 inches.

OBSERVATIONS AT UTICA ACADEMY.

SUMMARY OF OBSERVATIONS AT WASHINGTON ACADEMY,

SALEM, WASHINGTON COUNTY, N. Y., DURING TEN YEARS.—(Aspect of sky eleven years.)

Latitude N. 43° 15'; Longitude W. 73° 30'.

OBSERVERS.

1828, '29, (ex. rain gage,) WILLIAM WILLIAMS, Principal.

1843, JAS. H. CARRUTH, H. B. PIERSON and CHAS. CLEVELAND.

1830, (ex. rain gage and wind,) WILLIAM WILLIAMS, Principal.

1844, WM. MCHARG, Principal.

1838, (ex. temperature and rain gage,) HENRY BARNES, Principal.

1845, CALVIN BUTLER, Principal.

1840, '41, WILLIAM BRAND, Principal.

1846, '47, CALVIN BUTLER, Principal, and Miss C. J. LONDON.

GENERAL SUMMARY.

ASPECT OF SKY.

Table with columns for STATIONS, JAN., FEB., MARCH, APRIL, MAY, JUNE, JULY, AUGUST, SEPT., OCTOBER, NOV., DEC. and sub-columns for Clear and Cloudy. Lists various locations like Albany, Amenia Seminary, Auburn, etc., with corresponding weather data for each month.

ANNUAL MEAN.

Table with columns for Clear and Cloudy, listing annual mean weather data for various stations including Albany, Amenia Seminary, Auburn, etc., and a final summary row.

MEAN DEPTH OF RAIN AND MELTED SNOW.

[At most of the stations reporting, the rule laid down in the Instructions, directing THE NUMBER OF DAYS on which it rained to be recorded, appears to have been misunderstood, the occurrence of fractions indicating that the number of HALF DAYS on which it rained were recorded in the same manner as the aspect of the sky. From this want of uniformity, the mean and total of days on which it rained or snowed were not ascertained or entered in the foregoing tables. The mean results of observations upon the rain gage are, therefore, the only ones that can be shown with any degree of certainty.]

To show the relative quantity of rain in the several seasons, as influenced by the more characteristic topographical features of the State, the following summary has been prepared. The stations have been grouped into seven classes, based upon circumstances in some degree common to those included in each.

CLASSES AND STATIONS.	SPRING.	SUMMER.	AUTUMN.	WINTER.
<i>Maritime Region</i> , including Clinton, Erasmus Hall, New-York Institution, Oyster Bay and Union Hall; all excepting one being on Long Island,.....	4,07	3,75	3,45	2,93
<i>The Eastern Region</i> , mostly in the Valleys of the Hudson and Lake Champlain, including Albany, Cambridge, Dutchess, Farmer's Hall, Granville, Hudson, Kinderhook, Kingston, Lansingburgh, Montgomery, Mount Pleasant, Newburgh, North Salem, Plattsburgh, Redhook, Washington,.....	2,92	3,62	3,05	2,56
<i>The Mohawk Valley</i> , including Fairfield, Johnstown, Oneida Institute, Schenectady and Utica,.....	3,23	3,67	2,96	2,86
<i>The Susquehanna Valley</i> and its branches, including Bridgewater, Cherry Valley, Delaware (on a branch of the Delaware), Franklin (Prattsburgh), Hamilton, Hartwick and Oxford,.....	3,00	3,92	3,17	2,72
<i>The Valley of the St. Lawrence</i> , including Franklin (Malone), Gouverneur, Ogdensburg and St. Lawrence,.....	2,14	2,95	2,44	1,71
<i>The Western Region</i> , mostly in the vicinity of the smaller lakes; including Auburn, Canandaigua, Cayuga, Ithaca, Middlebury, Oneida Conference, Onondaga, Pompey and Syracuse,.....	2,49	3,40	3,06	2,04
<i>The region of Lakes Erie and Ontario</i> , including Buffalo, Fredonia, Gaines, Lewiston, Lowville, Mexico, Millville, Monroe, Palmyra, Rochester, Springville and Union Literary Society,.....	2,19	2,95	3,30	1,94
<i>Relative quantity in the whole State</i> ,.....	2,38	3,44	3,04	2,35

COMPARISON OF THE EXTREMES OF TEMPERATURE OF EACH STATION.

A comparison of the foregoing table gives the following results:

Total number of days on which Solar Haloes were observed,	455
“ “ “ Lunar “ “	439
	Solar. Lunar. Total.
Observed in Winter months,	110 167 277
“ Spring months,	196 128 424
“ Summer months,	87 51 138
“ Autumnal months,	62 93 155

Showing the prevalence of haloes in the spring months, a fact which coincides with observations made elsewhere.

OBSERVATIONS UPON THE AURORA BOREALIS.

The State of New-York is in some respects well situated for the observation of Auroras, the records of a quarter of a century indicating that this phenomenon appears on an average nearly fifty days in a year. It is to be regretted that the descriptions given were too often vague and indefinite, both in the indication of *time* and *place*, without which comparisons leading to a definite knowledge of their height, distance and rapidity of motions are impracticable. The records however are of interest as indicating the frequency and geographical extent of auroras, as well as a general knowledge of the varieties of form and motion which they present. To ascertain their comparative extent, notices of their appearance beyond the limits of the state, and at stations not regularly reporting to the Regents, have been compiled from such sources of information as were within reach, and are embodied in the following pages.*

The number of days on which auroras were observed in New-York, and the whole number given in all the records that have been consulted, including those of New-York, is shown in the following table.

An examination of the above table will show that in New-York there was a progressive increase of the days on which auroras were observed, from December to April; decreasing in May and June, and attaining their maximum in September. The months arranged in the order of the frequency of auroras, commencing with the highest number, would stand as follows: September, April, August, October, March, July, February, May, June, January, November and December. In the years 1850, 1830, 1840, 1841, 1848 and 1849, an unusual number of auroras were reported.

* Besides the annual reports of the Regents, in which numerous notices of this phenomenon as observed beyond the limits of the state occur, the "American Journal of Science and Arts," the "New-York Municipal Gazette," "Edinburgh Philosophical Journal," "London and Edinburgh Philosophical Magazine," "London Athenaeum," "Comptes Rendus" and other literary and scientific periodicals, the narratives of Sir John Franklin's second voyage, and of Captain Back's overland journey to the polar regions have been examined, and all the dates of auroras from 1826 to 1850, furnished by these sources, are noted in the following tables. The editor is especially indebted to Captain J. H. Lefroy, the late Director of the Toronto Magnetic and Meteorological Observatory, for an extended list of dates of the appearances of auroras during several years in Europe and in Canada. It is much regretted that fuller records from the north of Europe were not accessible, in perfecting this department of the work.

GEOGRAPHICAL EXTENT OF AURORAS.

In order to present a condensed synopsis of the stations at which auroras were observed, their names only will be given in the following lists. Stations reporting officially to the Regents are *italicized*, and at those marked thus *, the appearance was described more or less fully. The material parts of these descriptions will be given at the end of the table.

DESCRIPTIONS OF AURORAS.

1827.

AUGUST 27. Erasmus Hall. Between 10 and 11 o'clock, streaks of light were seen issuing from a point a little above the horizon, in the W. N. W., passing near the zenith, and extending to the eastern horizon. They were about thirty minutes broad in the west, and grew wider towards the east. Brightness variable; it moved towards the south, and gradually disappeared.

Lowville. At 9 P. M., a segment of a circle, of a more dusky hue than the sky in general, appeared, occupying at least one-sixth of the circumference of the horizon. The arc of this segment was well defined, and the altitude of its highest point not less than 25°. The lustre of the stars in the dusky space was undimmed. The arc was strikingly illuminated, and the phenomenon was enlivened by light coruscations rising from the arc, and reaching more than half way to the zenith. At 15 minutes past 10, the whole segment became luminous, and such was the strength of the light, that shadows were discernable on the south side of objects, and large letters (as the titles of newspapers) were easily read. Continued till near or quite daybreak.

AUGUST 28. Albany. Noticed a splendid arc of light at 10 P. M., passing from north to south over the zenith, and extending from east to west; it remained about an hour, and gradually disappeared, after passing six or eight degrees south.

Montgomery. It had the form of a luminous and transparent scud; stars perceptible through the densest part, which was wider than the milky way; northern edge more luminous than southern; it seemed to be a reflection of the Aurora Borealis, and rose out of the eastern horizon.

Cherry Valley. Between 9 and 10 o'clock P. M., the centre of the arc was 10 or 15° southerly of the zenith.

Clinton. Brilliant light in the north; at the same time, the arc gradually broke in passing south; wind a light breeze from the west. Noticed with similar observations at

Franklin, P. Auburn, Hudson, Ithaca, Middlebury, Hartwick.

Lowville. At 9 P. M., a faint light in the north; at half-past 9, an arc was suddenly formed, the upper part of which was of a pure whitish light, and 8 or 10° broad; the extremities were wreathed of light and shade, and in a manner imitatively sublime. The arc remained entire three-quarters of an hour, its highest point being at first about 10° north of the zenith, one of the extremities meeting the horizon a little south of the east, and the other a little north of the west point. During the existence of the arc, its constituent matter passed, in a rapid and ceaseless current, from east to west; and soon after the arc was formed it began to move (the extremities, however, advanced but little) in a southern direction, and continued its progress until it descended as many as 40° south of the zenith; it then was broken up into parallel pieces, which moved majestically westward, and gradually diminished in magnitude and lustre, till at length every vestige of the arc disappeared. The light in the north at this time began to increase, and continued until it became much brighter than the evening previous. At 11, the coruscations shot beyond the zenith, and the whole luminous arc exhibited an undulatory motion. This field of light somewhat resembled frequent lightning in a distant thunder storm seen by night, but with these points of difference, that its color was less vivid than that of lightning, and its luminous appearance remained though its motions ceased; the luminous substance, as it sped, exhibited various hues and shapes; it was for the most part whitish, but there might also be seen shades of yellow, orange and red; its motion was mainly south. In some regions it was wafting, and diffused itself as light clouds are sometimes agitated when exposed to contrary winds, and in other places, it arranged itself in the manner of diverging rays. The most interesting view was enjoyed at half-past 11 o'clock. The space then occupied by the *floating light* was more than two-thirds of the whole concave heavens.

Utica. At 15 minutes before 10, the Aurora assumed a most extraordinary appearance. Brilliant streams of light shot up in the

heavens, near the Pleiades, and rapidly extended over the heavens in a westerly direction, presenting in a few minutes a most beautiful and splendid arc of light, its central elevation about 55° or 60° from the northern horizon, passing between Ursa Major and Boötes, and the end resting in the western horizon, near Arcturus. Its width considerably exceeded the rainbow; and its centre gradually rising as if moved by a gentle breath of wind, "with its fleecy folds of light" moving through the arc from east to west, it surpassed in beauty anything of the kind that the eye of man ever witnessed. After about 20 minutes, the eastern end of the arc appeared broken, and with a tremulous, undulating motion, it grew fainter, rose in the heavens till it passed the zenith, and disappeared. The weather was remarkably clear and calm, and had been so through the day. Thermometer at 9 in the evening 54°; at 2 P. M. 70.

Pompey. Luminous arc, commencing at 9 P. M. and continued till 11. It commenced near the eastern and western points of the horizon, somewhat resembling two candles. The light shot upwards, gradually widening and extending till two splendid pillars appeared resting on the horizon. These continued to extend in length; when, meeting in the zenith, they formed a magnificent arc of light, to the eye about 25 feet wide, and extending across the whole heavens. A rapid motion was distinctly visible in the luminous arc. The arc gradually inclined towards the south, dividing into separate portions, and disappeared. At the time it passed away, the Aurora shot up in the north in the most brilliant and sublime manner. Similar phenomena were observed at Perth and in Roxburghshire in Scotland, on the evenings of the 27th and 28th of August. On the 27th the coruscations were very rapid and transient, and overspread nearly the whole northern hemisphere. Some of the flashes were almost vertical; and latterly they resembled, in clearness and motion, the undulations of a bright flame. The Aurora of August 28 was visible throughout the Northern States, Canada and a great part of the Atlantic Ocean.

SEPTEMBER 9. Lowville. A light in the heavens as before, but not so broad or extensive.

Utica. Appeared at half-past 8 P. M., passing from east to west. The east end broke first and the centre gradually rose. It disappeared by degrees, and at about 10 minutes before 9 P. M. was entirely gone.

25. **Lowville.** Streaks of light as before.

1828.

AUGUST 16. Utica. A beautiful arc, very similar to the one of September 9, 1827. The arc was less complete and its duration less.

SEPTEMBER 8. St. Lawrence. Coruscations extending nearly to the zenith, illuminating about one-half of the horizon, and very brilliant.

29. **Albany.** Very brilliant coruscations.

Lowville. Vast segment of a dusky area and luminous arc—lively coruscations; stars distinctly seen in the area. It continued several hours.

OCTOBER 8. Albany. At 12 P. M. a brilliant arc, at right angles to the magnetic meridian, about 5° wide, and the crown 10° above the horizon.

1829.

APRIL 8. St. Lawrence. Aurora resembling a bright cloud, and exhibiting near the horizon a steady light of several hours' continuance.

JUNE 1. St. Lawrence. Very brilliant Aurora, appearing in distinct arcs, one above another, the highest subtending an angle of about 75°.

7. **Schenectady.** A brilliant Aurora all night.

SEPTEMBER 19. St. Lawrence. Aurora describing an arc on the plane of the horizon, of about 65°, and rising in distinct spires towards the zenith. Between 8 and 11 P. M.

26. **Albany.** About half-past 9 P. M., a brilliant Aurora observed. It was composed of beams occasionally shooting up as high as the pole-star, from a point of the horizon a little to the west of true north.

OCTOBER 27. *Delaware*. About 8 P. M., three perpendicular columns of light appeared in the north, the central one extending about 20°, and the two external ones about 15° above the horizon.

NOVEMBER 9. *Lowville*. Aurora with brilliant and brisk coruscations at half-past 4 A. M.

NOVEMBER 19. *St. Lawrence*. Faint, with occasional spires extending towards the zenith.

DECEMBER 28. *Hartwick*. Between 7 and 8 P. M. a light in the west, a little south, with rays, supposed to be an Aurora. At *North Salem*, a brilliant Aurora.

1830.

FEBRUARY 23. *Lowville*. Light in the west, at half-past 8, like twilight.

MARCH 15. *Franklin, P.* An Aurora, somewhat like the dawn in the morning before sunrise. At *Utica*, very brilliant.

31. *Franklin, P.* At 10 P. M. a single column of light, a little west of north, at right angles with the horizon, and extending up about 25°.

APRIL 19. *Auburn*. From 8 P. M. till near midnight, the whole northern horizon presented at times streams of light, which rose, enlarged and disappeared in succession, sometimes extending almost to the zenith, at others, rising only a few degrees, and usually succeeded by a dark, hazy appearance. The light from this source was sometimes as much as the moon affords three or four days after conjunction. At *Cambridge*, very brilliant.

Franklin, P. At 9 P. M. a broad column of light, perpendicular to the horizon, and extending up about 45°; the whole was so brilliant as to cast shadows; at midnight still more brilliant. Brilliant also at *Canandaigua, Cayuga, Hudson* and *Lansingburgh*.

Lowville. Nearly one-third of the horizon was illuminated during the night; the highest part of the illuminated segment extended to the height of 45°, and lively coruscations and various hues of great beauty, especially a reddish tinge of vast extent, appeared at 9 o'clock. At *Oxford, Pompey, Rochester, Union Literary Society* and *Utica*, very brilliant; visible in England and a large part of the northern hemisphere.

MAY 2. *Lewiston*. Brilliant Aurora, 40° above the horizon, at 8 P. M.

JUNE 10. *Albany*. Between 8 and 9 P. M. an arc across the heavens. *Auburn*, very brilliant all night.

Canajoharie, a luminous arc. At *Erasmus Hall, Fredonia* and *Hartwick*, very brilliant.

Mount Pleasant and *Kinderhook*, very splendid, and the light sufficiently strong to cast shadows. At *Lewiston*, very brilliant. At *Lowville*, very beautiful, and extending from the east to west, and widening to the northern horizon. A beautiful arc at *Oxford, Pompey, St. Lawrence* and *Utica*.

JUNE 11. A splendid arc at *Dutchess, St. Lawrence* and *Utica*.

JULY 14. *Hartwick*. Bright, luminous arc a little south of the zenith, from east to west, descending to the south. At 10, very brilliant at *Lansingburgh* and *Lowville*.

15. *Fredonia*. Between 8 and 12 P. M., at first resembling a bright cloud in the form of the segment of a circle, the crown being about 30° above the horizon, exhibiting for several hours a steady light; about 12, it rose in distinct and brilliant spires, shooting towards the zenith. From 9 to 10 were seen, occasionally, beams of light shooting from two points a few degrees east and west of the luminous segment, uniting and forming a belt at right angles with the galaxy, and resembling it in width and appearance, except much more luminous. This moved towards the south, and after passing the zenith, separated and disappeared.

AUGUST 19. *Utica*. Uncommonly beautiful.

20. *Utica*. Unusual Aurora. At half-past 9 the flashes of light, apparently proceeding from a dense cloud in the horizon, shot up very high in pencils; at 10, a broad arc, resting in the horizon, in nearly the western point, rose between Arcturus and Ursa Major, and extending over the whole heavens, a little north of the zenith, terminated about 20° above the eastern horizon. Between this arc and the pole star stood a row of perpendicular columns of light, with uniform bases, in a right line from Arcturus to the pole star. There were sixteen pillars on the inside of the arc, and one on the outside below Arcturus; they maintained their position for nearly half an hour, and gradually ascending in the same regular order, grew fainter and disappeared. The flashes in the horizon still continued very light, but not distinctly defined.

26. *Auburn*. Continued all night.

SEPTEMBER 7. *Lewiston*. A low but regular arc, not over 20° above the horizon at 8 o'clock, but by the interposition of vapor between the top of the arc and the horizon, forming a perfect segment of a

circle; at half-past 8, two very bright lights, extending from the top of the arc to 50°

SEPTEMBER 15. *Pompey*. Very brilliant, in columns springing from an arc with prismatic colors, resembling those produced by finely striated metal.

OCTOBER 28. *Lowville*. Very brilliant. At *St. Lawrence*, very brilliant over the whole north, and extending to the zenith, where it presented a fiery red appearance. Large red belts were occasionally seen streaming from the west, towards the zenith, and extending in one instance nearly to the east, spanning the chord of an arc of about 160° and about 8° or 10° broad.

DECEMBER 7. *Plattsburgh*. Very brilliant.

10. *Dutchess*. Very brilliant.

11. *Albany*. Between 9 and 10, splendid. It began to appear early in the evening, in the north, stretching around from seven to eight points of the compass, and from nearly N. W. to nearly N. E. The principal light was in the form of an arc, the centre of which was directly under the north star. There was a general suffusion of light over the arc, and extending 20° or 30° above it. The space beneath the arc, in the early part of the evening, was filled with a dark cloud. At about half-past 6, a row of bright pillars or columns rose from the arc, and extended to a great height above it, and some of them nearly as high as the north star; those over the N. W. limb of the arc were slightly tinged with redness, and all the others were perfectly white. These pillars or columns soon disappeared and were succeeded by others; they generally rose over one limb of the arc first, and gradually extended to the other. Between 6 and 7 o'clock the dark cloud beneath the arc rose, and spread over a great part of the sky, and for some time entirely obscured the Aurora. At about 8 o'clock some clouds had passed away, and a considerable portion of the upper part of the northern sky had become clear again, and a row of bright white pillars or columns rose from or through the dark clouds beneath, and extended far beyond the north star. These pillars or columns remained but a short time, and the whole northern sky was again obscured by other clouds, and so continued through the greater part of the night. Through the intervals between the clouds, or the thin places in them, the light of the Aurora was frequently seen in bright white spots over the northern part of sky. The Aurora continued throughout the night; and between three and five o'clock on the following morning the sky had become clear and the Aurora was quite bright. Very brilliant at *Auburn*.

Erasmus Hall. It was very brilliant, illuminating the horizon, and issuing several perpendicular columns, extending in a direction towards the zenith, from 15° to 20°. The appearance was not unlike an extensive conflagration.

Lowville. There appeared two ranges in the north, one above the other, and though irregular, yet, in their main direction, parallel, and resembling two sublime ranges of mountains, with dark sides, and slight summits of immense height, from which the brilliant coruscations were, by the imagination, easily converted into volcanoes. In the horizon the light extended from the southeast almost to the west, and the currents and flashes of light rose from the north horizon to the zenith and thence descended half way to the south horizon. This Aurora appeared with extraordinary brilliancy in England, appearing like red and purple flames. The year 1830 was remarkable for the frequency and brilliancy of Auroras. The observer at *Utica* remarked, that in nearly every instance the phenomenon presented a dark, dense and regularly defined cloud, lying in the northern horizon, and extending far to the east and west, apparently a ground work from which the light proceeded. Sometimes this cloud existed from the first, and at others it was not visible until after the light had been observed some hours. When the flashes had continued late in the night, the cloud ascended above the horizon, and the brilliancy of the light diminished. In one instance (December 11), after the cloud had risen ten or fifteen degrees above a clear horizon, a second cloud appeared, from which the flashes of light were distinctly seen shooting to the upper one.

1831.

JANUARY 7. *Fredonia, North Salem*. Brilliant Aurora.

FEBRUARY 6. *Albany*. At 8 P. M. an arc 12° or 15° high; at half-past 8, columns with dark cloud below. Very brilliant at *Oxford*. Slight at *Mount Pleasant*. At *Cherry Valley*, very brilliant, assuming a variety of shapes and forms; stupendous arcs from east to west, crossing the heavens. At *Franklin, P.*, very brilliant, extending nearly 130° around the horizon. At *Hamilton*, seen rising in the N. W. and stretching towards the east. At *Cazenovia*, unusually brilliant. At *Erasmus Hall*, very bright.

MARCH 8. *Lowville*. Lively. At *Utica*, between 8 and 9 very brilliant.

18. *Fairfield*. Very bright Aurora.

APRIL 1. *Utica*. Very brilliant. At *Albany*, faint at half-past 8 P. M.; at 10 a low arc, which at half past 10 shot up into brilliant columns, moving eastward.

18. *Union Hall*. A beautiful Aurora.

19. *Gouverneur*. Very brilliant. At *Lewiston*, uncommonly brilliant, extending higher and farther to the south than before noticed. Very brilliant at *Oxford*, *Dutchess* and *Mount Pleasant*.

Middlebury. Coruscations in almost every part of the visible horizon.

Utica. Began to attract attention soon after 8 o'clock; streams of light uncommonly brilliant, were shooting up in N. E. by N. and N. W. by N. forming in a few minutes a beautiful arc, like a well defined rainbow, its ends resting in the horizon and its vertex being in the magnetic meridian, elevated about 50°. It gradually arose, passed the zenith, and retaining its brightness, descended into the south within 25° of the horizon, its end still resting in the eastern and western horizon. This arc was soon succeeded by others, broader and fainter, which rose and descended in succession, and all contributed to give the face of the heavens a beautifully illuminated appearance. As these arcs began to disappear, the space between their bases in the north was so strongly lighted as to give objects a well defined shadow. At 9, the streams of light, of purple, yellow, green and other colors, more intense than had yet been observed, were rising where the eastern end of the arcs had stood, and exhibiting rapid horizontal motions, passing and repassing like a company of dancers. The phenomenon was particularly remarkable for its greater brilliancy and its greater extent over the heavens, than any which have been before observed in this place. The observer had no means of marking its effects upon the magnetic needle or upon an electrometer. Before 10 a dark cloud rose in the north, and extending over the heavens, rendered the Aurora invisible.

Franklin, P. 11 P. M., nearly half of the concave surface of the heavens was illuminated, at one time; for the space of about three minutes, streaks of light from almost every point of compass, north of east and west arose nearly at the same instant, tended towards the zenith where they intersected each other, forming a large number of spherical triangles.

Hudson. Brilliant, commencing about half-past 8 in the west and north west, shooting up in spangles towards the zenith, very much like the process of crystallization under the solar microscope. These constantly faded, and were succeeded by others in different lines, exhibiting at times most of the colors of the rainbow. About half-past 9, similar appearances were seen in the east and south east, meeting those first mentioned at the centre above, and forming an illuminated dome of spars and spangles, the most brilliant and beautiful ever beheld.

Fairfield. It illuminated nearly the whole heavens; a number of bows, commencing in the N. W. passed south of the zenith and terminated in the N. E. The sky was very cloudy.

Hartwick. Splendid. A nucleus about in the zenith, moving to the south, with bright rays in every direction at about 8½ P. M.

Kinderhook. Uncommonly beautiful streaks of light ascending to the zenith. The same at *North Salem*. At *Erasmus Hall*, a luminous arc.

Albany. Brilliant. First observed about 9 P. M. in the south, in the form of an arc 9° broad, and about 20° above the south part of the horizon. At 9.45 the clouds passed from the north, columns were observed shooting up to the zenith, from the whole northern hemisphere. At 6 o'clock P. M. a remarkable increase was observed in the Magnetic intensity at *Albany*, but during the most brilliant display of the Aurora, the intensity was considerably lower than usual. A similar observation was made in relation to the relative intensity of magnetism, before and during Auroras, by Prof. Hansteen, and also by Humboldt and van Swinden.

New-York. This Aurora was described as appearing at 9 P. M. and peculiarly interesting, on account of the meeting of the luminous columns in the magnetic meridian, at the point in the direction of the dipping needle towards which they usually tend. The luminous matter occupied the whole northern half of the heavens, and was very much condensed near the point of convergence. Some of the eastern coruscations were at times transiently curved, as though their middle parts were driven eastward by the impulse of the westerly breeze, which was blowing at the time. A luminous band was at one time extended across the heavens, at right angles to the meridian, and 30° south of the zenith. This had at times an oscillatory motion in a north and south direction. It passed near the moon, around which was one of the large haloes. The sky had been previously clear. The converging rays appeared to meet at the star δ Leonis, which was found to give it an altitude of 70°.25' and an azimuth 11°.27' east.

Cherry Valley. It was very brilliant, assuming a variety of forms; at one time appearing as a stupendous arc, crossing the heavens from east to west; at another radiating from a point south of the zenith. Mr. Christie, of Woolwich, England, observed the same evening, at 10 o'clock P. M., the horizontal magnetic intensity was less than usual, when it increased until 10h. 37½m, when it was greater than in its undisturbed state. It then again decreased, and was less than usual the next morning at 7h. 20m. A comparison of these observations with those at Albany, making an allowance for the difference of time, shows a simultaneous disturbance of terrestrial intensity, although the changes did not occur in the same order. The Aurora that accompanied this disturbance, appeared in England very splendid. At one time there was a grand display of ten long active streamers along an arc of the Aurora, several of which ascended to an altitude of 60°; and when most active, many passed beyond the zenith, exhibiting at the same time several prismatic colors. At 10 o'clock the arc of the Aurora extended 150°*.

APRIL 20. *Louville*. An extraordinary Aurora. At 9 P. M. the currents of light almost filled the visible heavens, and there was a remarkable convergence to the zenith as its centre; the light was spread from the eastern to the western horizon, and what was very remarkable, the southern horizon was filled with a dusky segment, having a faintly illuminated arc of about 60°.

JUNE 10. *Albany*. About 10 P. M. a dark cloud was observed in the north, from which flashes of heat lightning were seen to proceed; about this cloud a slight tinge of auroral light was observed; at 11, the Aurora became brilliant, shooting up into columns. There had been a strong south wind, at 7 P. M. for a short time. Seen at *Utica*.

16. *Albany*. At half-past 10 in columns suddenly shooting up.

17. *Albany*. Faint Aurora, at 11 P. M.

21. *Ithaca*. Splendid. Commencing at 10 P. M. and continuing for some hours.

Albany. About 10 P. M. appeared like a cloud in the north, 10° high. At 10.30 it shot up into brilliant striated prismatic columns, which moved from west to east, preserving in their motion a parallel position. In one or two instances, a sudden and rapid motion in the opposite direction, towards the west. The wind was from the west, and a sudden reduction had taken place in the temperature two hours previous. The Auroras this year appear to be accompanied by a reduction of temperature, and by considerable wind, a few hours previous. At 11 P. M. the Aurora had disappeared, and the clouds seemed to be blown in long rows, from a point of the horizon nearly corresponding with the centre of the Aurora.

JULY 1. *Canajoharie*. At half-past 10. At *Cazenovia*, faintly visible at 11.

2. *Cazenovia*. Faintly visible.

3. *Cherry Valley*. Very brilliant. At *Cazenovia*, brilliant at 10½ P. M.

Kingston. Very brilliant.

Albany. A faint light was noticed at 9 P. M. in the north, which appeared like an Aurora; at 10 shot up into columns about 20° high; these appeared to move slowly in some cases to the east. The motion, however, was not as rapid as on the 21st of June. At 11, a distinct arc of short parallel beams, like the palings of a fence, was formed; these were all about the same length, and remained nearly stationary for about half an hour; their lower extremities formed a regular arc, the highest point of which was about 15° above the north point of the horizon; the beams occasionally shot up a little towards the zenith, but their lower extremities remained perfectly stationary on the extrados of the arc. At 11h. 40m. the parallel bars or beams disappeared, and the Aurora appeared like a uniform diffused light. There was a gentle wind from the east.

JULY 4. *Erasmus Hall*. Very brilliant. At *Albany*, a diffused light was noticed at 9 P. M. At 10 much more brilliant, with some appearance of beams shooting up nearly to the zenith or more than 70°. The northern part of the heavens was covered with dark clouds through which the Aurora was visible in spots. The Aurora appeared very brilliant, but in diffused light, with the beams not well defined. At 10h. 20m., very brilliant, in the forms of Columns, extending around the northern hemisphere to the eastern and western points of the horizon; at 1 o'clock it assumed the form of a broad arc, about 15° above the north point of the horizon, with its extremities in the east and west nearly.

Albany. Cloudy in the north. At 9½ the auroral light shone through the clouds. At 10 P. M. it was obscured by the clouds, except a faint light near the edge of the horizon.

31. *Johnstown*. About 10 o'clock P. M., a streak of light was seen extending in a direct line, east and west, through the whole ex-

* See Appendix to Regent's Report, 1832, where this phenomenon was more particularly discussed by Prof. Joseph Henry, then of the Albany Academy.

tent of the heavens. When first observed, it was in the zenith. It moved south in a line parallel to itself about 20°, and then gradually disappeared. No other lights were visible at the time.

AUGUST 6. *Cazenovia*. The Aurora was faintly visible at 9½ P. M. in the north west.

OCTOBER 29. *Hartwick and Cazenovia*. Auroral arc noticed from N. E. to N. W. Arc like a rainbow at *Canajoharie*. Noticed at *Utica*. *St. Lawrence*, very bright. At *Lowville* it was bright and the illuminated region very extensive.

DECEMBER 9. *St. Lawrence*. Brilliant.

1832.

MARCH 27. *Pompey*. At 9 P. M. with a faint white light, extending a third of the way to the zenith. Continued two or three hours.
MAY 12. *Kinderhook*. A lurid bank in the north, with occasional beams of light shooting up.

AUGUST 12. *Cazenovia*. Feebly visible.

22. *Franklin, P.* Very brilliant, and continued all night. At *Lowville*, it appeared with a steady pale light; no flashes or streaks. It extended 45° west of north. Some lightning in the south east.

Cazenovia. Very brilliant at 9 P. M. An arc of about 60° of the northern horizon, was spanned by two arcs of light, the upper one narrow, the lower one reaching over the whole northern horizon. The altitude of the northern and highest part of the arc was about 30°; this appearance soon changed and streams appeared shooting towards the zenith. It continued brilliant through the night.

23. *Ithaca*. A splendid Aurora noticed during most of the evening; the southern termination of the light was bounded by a broad bright arc, both ends resting on the horizon; it presented an appearance nearly phosphorescent. The inner edge of the arc was about 30° above the northern horizon.

Canandaigua. At 10 P. M. unusually brilliant. At first appeared in two pillars nearly in the east and west, which shot up and formed a luminous arc of great brilliancy. At *Auburn*, brilliant at 9 o'clock, also at *Kinderhook* and *Fredonia*. Unusually bright at *St. Lawrence*.

Utica. A few minutes past 11, it assumed the appearance of a well defined arc of light, having its vertex elevated about 55° on the magnetic meridian, and its ends resting in the N. E. and N. W. horizon. Through its whole course the light was uniformly dense, and the edges distinctly defined. It was very brilliant for several hours, and a dark cloud rested in the north from which the streams of light apparently rose.

Fairfield. About half-past 9 a dark arc was seen extending from N. E. to N. W.; the whole sky enclosed by the arc was of a beautiful yellow, constantly variegated by streaks shooting up from 20° to 40° above the horizon, and often moving laterally with great rapidity, and at the same time there was a constant waving from the horizon towards the top of the arc. Some broad rays of light were contained above the arc to the zenith. No wind perceptible, but the vane pointed north west.

24. *Gouverneur*. Very brilliant Aurora.

SEPTEMBER 1. *Cazenovia*. Feeble Aurora.

23. *Cazenovia*. The Aurora occurred as an arc across the north horizon

1833.

MARCH 17. *Franklin, P.* Very brilliant.

24. *Albany*. Bright.

MAY 16. *Hudson*. Brilliant. At *Hamilton*, very brilliant. At 9

P. M. arc, at one time reaching across the heavens from N. W. to S. E.

17. *Lewiston*. Very brilliant from N. W. to E. by S. about 9 P. M. They assumed the form of spires, and rising from the horizon, met south of the zenith in a focus of uncommon splendor.

Hartwick. Splendid at half-past 9. Brightness at times equal to that of the full moon, and continued flashing.

Kinderhook. Resembled rising flames of a mighty conflagration, with the exception, that occasionally the bright flames disappeared and as suddenly broke out with renewed splendor.

Albany. Very brilliant at 10 P. M., parallel columns of light, which moved rapidly from north to south. At *St. Lawrence* first noticed at half-past 8 P. M., from which time till a few minutes past 9, it had nothing more than its usual appearance. At half-past 9 and during one-quarter of an hour the whole heavens, except a small section near the southern horizon, were almost like an unbroken sheet of flame, shooting up from all quarters towards the zenith, where, at times, it was seen in the form of distinct rays of light, meeting in a point. In the south the coronations rose as it were from a line in the form of a bow, whose highest part was situated exactly in a south direction and elevated at an angle of about 30° with the horizon. At 10 o'clock it had nearly disappeared in the south, but continued bright in the N. and N. W.

Cazenovia. Very brilliant and beautiful. At about 25m. past 9 an arc of light, nearly unbroken, extended from the western quite to the eastern horizon. The altitude of the highest part of the arc was about 41°, and very nearly on the meridian. At 35m. past 9 the arc had quite disappeared and streams of light were seen shooting from nearly every part of the horizon, from the N. W. to the E. directly towards the zenith, and nearly reaching it. During more than fifteen minutes the light was sufficiently brilliant to enable a person to observe the time by his watch with perfect distinctness.

At 10 o'clock nothing but a faint glimmering light was to be seen in the west. The color of the light somewhat varied from white to yellowish. At *Utica* the Aurora began to be visible at half-past 8, and although at times somewhat obscured by clouds lying in the northern horizon, at 9, its appearance was strikingly marked and beautiful. From the whole northern horizon, extending nearly to the west, columns of light, exhibiting very distinctly many of the prismatic colors, arose from the horizon, and sent forth flashes and streams of colored light, extending to the zenith. From this point parallel arcs or belts, ranging in an easterly and westerly direction, seemed to concentrate the rays of light as they flashed up, and from the belts quick and repeated flashes of pale red light passed alternately, very much resembling the heat lightning of a summer evening. This brilliant display, so strikingly different from any appearance of the Aurora which had ever been observed here before, continued till a quarter past 10 o'clock. At this time the whole northern part of the hemisphere changed its appearance, and presented a beautiful glow of soft mellow light, very uniformly diffused. At a few minutes past 10 the whole appeared as if agitated by a strong wind, and with flashes intermingled in every form, was moving upwards with inconceivable rapidity, presenting an appearance somewhat resembling the letting off of steam from the highly charged boiler of a steam engine, but covering the whole face of the heavens in the north, and extending beyond the zenith into the south, appearing to descend within about 45° of the horizon. At 11 the columnar forms reappeared, but their number was much greater, and the light was so strong and steady as to throw shadows, defined with as much distinctness as from the light of the moon in her quadratures. At 12 o'clock the flashes still continued with little diminution.

JUNE 29. *Cherry Valley*. Very brilliant at 10 P. M.

JULY 10. *Cherry Valley*. A very brilliant Aurora, from 9 P. M. to 1 A. M. of the 11th. A large part of the northern hemisphere was illuminated, and streams occasionally shot up to the zenith.

Erasmus Hall. Very brilliant at 10 P. M. in the N. E., and from a bright yellow, changed gradually to a fine light green in the north. Several auroral spots at the same time near the north star, and two radii in the east, one of which shot almost to the zenith, in color varying from a light yellow to a deep blue; lasted about 30 minutes.

Ithaca. Very brilliant. One beautiful shaft shot up directly in the east, rising about 80° from the horizon and spreading out at the top in the form of a fan. Uncommonly brilliant. At *Albany* and *Lowville* very brilliant, at the latter place nearly reaching the zenith. Seen at *Montgomery* from 8 to half-past 10.

Utica. It commenced at 10 minutes before 9; a bright light appearing above a dark cloud lying in the horizon, was soon deepened and extended by pillars or columns shooting up from different parts and reaching to a very great height. All however appeared to point in the direction of the magnetic meridian. At half-past 11 these pillars, which were rising and disappearing in rapid succession, formed several arcs or belts, terminating near the western horizon and extending across the milky-way. These arcs were soon broken, and formed into small stripes, parallel and in an oblique direction. The whole display was principally columnar, reflecting a pretty strong light, and assuming forms very similar to several that have been observed in this place for a few years past. It grew fainter soon after midnight.

Neuburgh. At about 45m. past 9, during a bright exhibition of the Aurora Borealis, a streak of light began to appear, beginning due east about 20° above the horizon and passing a few degrees south of a west course to about 10° W. of the meridian. It was about 2° in breadth, and increased in brightness for 20 minutes, when it began to fade, and disappeared in 15 minutes past 10. When brightest, its edges were very distinctly defined. It crossed the *via lactea*, which was then about 40° above the horizon, at nearly right angles, and was at least seven fold as bright. It reappeared a few minutes past 12 at midnight, with its former lustre, extending from the horizon in the west to about 40° in altitude, and somewhat broader than before.

SEPTEMBER 5. *Albany*. At 8h. 40m. a luminous bow about 5° in breadth, extending from the N. E. to the N. W. horizon, the most elevated part being about 31° 30' above the northern horizon. At *Cherry Valley*, very brilliant at 8 P. M. A luminous arc 10° or 15°

in breadth spanning the northern part of the heavens, and elevated at its summit about 40°, or near to the pole star, while within and above it the deep azure of the heavens was not obscured by a single cloud, and no vertical streams of light were seen. At 9 P. M. all had vanished but a few faint streaks. At 10, another larger and less brilliant arc appeared.

Erasmus Hall. Brilliant.

Utica. It presented a columnar appearance; light strong, and rays prismatic.

North Salem. Very brilliant coruscations shot up beautifully.

NOVEMBER 3. *Utica.* Splendid. The quantity of luminous matter was unusually great, exhibiting the appearance of fleecy clouds disposed in layers and ares, at first lying several degrees above the northern horizon, then rapidly rising in the centre, passing beyond the zenith; sometimes continuous at other times broken, but the belts broad, dense and well defined. At 11 o'clock the belts had mostly disappeared and the appearance columnar; the light unusually strong and the flashes brilliant. At *Lowville*, very brilliant, in successive flashes to the zenith, and thus a space of about 30° was kept in a continual glow.

Montgomery. From 8 to 11, extending 8° each way from the north star.

DECEMBER 29. *Utica.* Very brilliant.

1834.

OCTOBER 8. *Utica.* Very brilliant.

NOVEMBER 2. *Auburn.* Noticed from 8 to 11 P. M., a beautiful arc extending from N. E. to N. W. nearly, and upwards of 25° from the horizon.

1835.

JANUARY 4. *Auburn.* Very brilliant. Are entire 20° from the horizon. No shooting. Stationary from half-past nine till eleven.

29. *Clinton.* An unusually pale light on horizon.

FEBRUARY 26. *Utica.* Through the night.

MARCH 1. *Cortland.* In the northeast.

JUNE 21. *Albany.* At 15 minutes past 10 P. M.

JULY 29. *Albany.* A single beam from the horizon, a few degrees west of north, extending about 30° towards the zenith.

AUGUST 19. *Ithaca.* A beautiful Aurora.

SEPTEMBER 4. *Bridgewater, Albany and St. Lawrence.* Unusually vivid. At *Oneida Conference*, bright, reaching at times nearly to the zenith.

9. *Albany.* At 9h. 45m. P. M., a faint white arc in the northern hemisphere, which moved towards and passed the zenith about 10 P. M.

22. *Albany.* A brilliant Aurora at 11h. 30m. An arc near the northern horizon.

NOVEMBER 17. *Albany.* At 5h. 35m. P. M., a mass of red light was seen in the east, which in a few minutes extended across the sky in the form of an arc, of a bright red color. About 5h. 35m. a white arc was formed nearer the zenith, and at the same time one below the first. At 6h. 30m. beams of white and red converged to a point south of the zenith. At 10.45 a zone of red light extended across the sky nearly east and west, and streamers of red, yellow and blue, from the whole horizon west, at a point about 15° south and east of the zenith.

Utica. It began at 5h. 15m. by shooting up broad columns of dense crimson light in the direction of east and west of north, between the Pleiades and Aries in the east, and Aquila and Lyra in the west. The intermediate space in the north was illuminated by a white and softer light, resting on a dark ground work on the horizon. The columns of crimson repeatedly appeared, sometimes of a paler and deeper hue, and often intermingled with other colors. At 8, the columns in the west were the most brilliant conceivable, more intense in color and extending very high in the direction of the magnetic meridian. From 9 to 11 the light somewhat diminished, but the glowing, silvery brightness of the north was much increased.

Clinton. Commenced about 6 o'clock, with a broad streak of light, at about W. N. W., a little above the horizon; at 7 o'clock it had risen to the height of about 45°, and spread to the north and eastward as far as E. N. E. At 9 o'clock, and from that time till about half after 10, the whole of the atmosphere, from W. N. W. to nearly E., was illuminated by a reddish light, the rays of which were sufficient to illuminate objects at as great a distance as they could be when the moon is at her quarter. This continued until about half-past 10, when the whole assumed a different aspect—all over head, and considerably to the south of the zenith, was of a bright crimson, and coruscations from N. to N. E. in pyramidal or spiral forms, based a little above the horizon, began to shoot up in rapid succession, all

tending towards, and nearly reaching a point a little to southward and eastward of zenith, displaying all of the prismatic colors brighter than the rainbow. At half-past 11 o'clock the whole disappeared; sky very serene the whole evening, and the stars shone with unusual splendor.

Fairfield. Very singular and splendid. At 6 o'clock the sky in the N. E. resembled a forest in flames. Presently the whole northern heavens presented the same red appearance. In a short time there were seen running up from the northern horizon, white bands, waving, suddenly appearing and disappearing. A faint dark colored bow passed from the N. E. to N. W., passing nearly through the zenith, and no clouds were to be seen, but stars were distinguished almost to the horizon. The heavens were evidently darker in this bow than without it; noticed the last time about 10 o'clock; slight red appearance still continued in N. E.

St. Lawrence. An exceedingly brilliant and unusual appearance. Zones of light, of the color of flame, overarched the heavens. Presently they gave way to a mellow light like that of the dawn, and this in turn was succeeded by flashes of scarlet colored light, shooting up from different parts of the northern horizon. Thus the scene continued to vary from 6 P. M. until a few minutes past 11 o'clock, when clouds overspread the sky.

Cazenovia. It was seen extending from the N. W. round to the N. E., presenting an interesting and singular appearance, from half-past 5 till 8 o'clock P. M.; streaming up sometimes with great brilliancy and at other times becoming almost imperceptible, and the color varying from a very clear white light to a deep red, the same column appearing alternately white and red, twice in succession in different parts of the heavens, from the horizon to the zenith. The different columns finally converged to a common focus near the zenith, and spreading off again to the S. and W., presented the appearance of a white luminous cloud, and thus gradually faded away at about 8 o'clock. The lights, however, in the N. W. and N. E., to the distance of about 30°, remained constantly of a deep red color.

Cambridge, Bridgewater, Cortland, Dutchess, Hartwick, Kinderhook, Middlebury, Newburgh, North Salem, Oxford, Oyster Bay, Pompey, Redhook and Union Hall. It is mentioned as splendid.

18. *Albany.* At 4 A. M., a very bright auroral light noticed in the N. W. At 9h. 35m. P. M., a low arc in the north and numerous beams from the northern horizon, extending about 45° towards the zenith.

Clinton. A uniform pale light appeared from N. W. to N. E., about 15° above the horizon.

Utica. The whole north was splendidly lighted with white and silver light, not diversified by crimson or other colors. No columns. Mentioned as more or less brilliant at the following academies: *Auburn, Cambridge, Bridgewater, Cortland* (bow in N.), *Johnstown, Kinderhook.*

Lewiston. Streams of light pink, white and lead colors shooting up from the northern horizon, resembling the glare of a conflagration.

Redhook. It came up in bright waves.

1836.

FEBRUARY 11. *Albany.* An Aurora with beams. At *Montgomery*, extending 15° each side of the north star, and continuing several hours.

APRIL 12. *Cazenovia.* A single beam from the horizon, 30° west of north, extending about 60° from the horizon towards the zenith. Seen from 9h. 45m. till 10 P. M. moving sensibly to the south; vanished at 10h. 30m.

19. *Cherry Valley.* Large and brilliant.

20. *Albany.* Several beams.

21. *Cortland.* From 1 to 3 P. M.

22. *Hartwick.* Splendid till 2 A. M. At *Kingston*, splendid, and continuing till 2 A. M. of the 23d, with singular and pleasing variety. Thin clouds were floating in the atmosphere, which at times were rendered intensely brilliant by sudden alternations of light and shade. At times, the appearances were those of streaks of lightning, radiating from a centre in the zenith, and terminating near the horizon. Towards midnight, the whole hemisphere became more brilliant; pencils and beams of crimson light were shooting forth in every direction, and various fanciful figures followed each other in the most rapid succession. The effect was diminished by the brilliancy of the moon.

Albany. Brilliant, with converging beams from the whole horizon; red in the west.

Cazenovia. Faint early in the evening, but towards 10 they changed to "merry dancers," occupying most of the heavens, except the extreme south, with great brilliancy.

Onondaga. At 12, very singular; low in every part of the heavens; N. W., shooting up in regular lines or streaks towards the zenith; N. N. E. and E., appearing mostly in variable luminous spots, and a few lines shooting upward; S. E. S. and S. W. in a horizontal direction; flashing or flickering, suddenly appearing and disappearing; sometimes resembling flashes of lightning (only slower in its movements) behind a cloud, when only the border of the cloud is partially illuminated; again, in other parts, resembling the waving or flapping of a sail or sheet in the wind; rather luminous and brilliant. Thermometer 30. Angle of elevation at south, not exceeding 25° or 30°.

Oxford. Splendid.

Utica. Soon after 9 o'clock, columns of strong and deep auroral light were seen rising from a dark cloud lying in the northern horizon, and shooting high towards the pole; these soon separated into rarer columns, of a spray-like appearance, passed off into the heavens and were succeeded by others of similar appearance, but some of denser and others of feebler light; the prismatic colors occasionally appeared in the larger. In a few minutes the rays were rapidly shooting up at various intervals of space, farther to the W. and E. The columns in the W. were higher and of a stronger light than in the E. At 11h. 20m. they had extended around the whole heavens, except 40° or 45° in the S. In less than half an hour, the whole circumference of illuminated rays began to assume an upward motion of successive wavings, somewhat resembling the disengaging of steam, and concentrated a little south of the zenith; there they formed an irregular ellipse, extending north and south, inclosing an area of clear sky, around which the rays of auroral light played like flashes of electricity on the edges of a cloud. These were sometimes diversified in colors, but more marked and of a deep crimson on the north side. A few minutes after 12, the star δ of Leo passed the meridian and was then in the centre of the illuminated circle. The stars elsewhere, except S., were obscured by the auroral light. The circumference of this figure was so strongly illuminated by the fitful flashes of light proceeding from the numberless converging rays shooting up with great rapidity from all points of the heavens, and inclosing a solitary star like a gem, in the centre, presented altogether a most beautiful meteoric phenomenon. Before 1, the sky was obscured as by dense mist and fog, and the rest of the night was cloudy.

Auburn. Uncommonly brilliant. At 11, it appeared somewhat like an outspread umbrella. Streams of luminous matter, mostly white, but sometimes beautifully tinged with yellow and pink, seemed to rush from all points of the sky, flashing and flickering, appearing and disappearing, and to fly with the rapidity of a rocket towards a point in the zenith around which was a splendid halo of light; this lasted three or four hours. Both this and that of the 20th was followed by snow.

From an article in the Albany Advertiser, on this Aurora, it is learned that during the day, the barometer had been rising, with the wind N. W., and the thermometer lower than the day before. At 6 P. M., the barometer stood at 30.225, thermometer 55° 75 and dew point 16°. First seen a little before 8, when beams of white light were seen shooting up to the zenith from N. and N. W., continuing with variable brightness till about 10, when others of peculiar brilliancy succeeded. Near the zenith, the beams were deflected to the south and then to the north, forming the segment of a circle, and at their union a large angle, with its vertex rounded and drawn towards the south. Faint beams from north. At 10h. 45m. entirely in the south, and the beams radiating from a point very near the vertex of an equilateral triangle, having for its base a line joining α and η of Boötes, proceeding thence towards the horizon, and by an apparent enlargement at two different places, formed imperfect arcs, but the whole was constantly changing, and at 11 overspread the whole sky, towards the S. W., of a deep crimson, while in other places it consisted of bluish and orange white beams of variable brilliancy. Soon after, the "merry dancers" appeared, at first south and then north, as if an intense light was alternately flashed upon and moved from a transparency. In 15 minutes it faded away rapidly, to reappear very brilliantly in E. N. or S. At 12, the barometer stood at 30.305, thermometer 28° 50 and dew point 19°. During this phenomenon, the beams moved from E. to N., W. and S. Between 12 and 1, an arc was seen passing from S. S. W. to N. N. E. Till 1 A. M., the sky was free from clouds, and without the dark space usual below the Aurora at the north. The smallest stars were visible. At the vertex, the appearance was that of four segments of circles, with convex sides towards each other.

Flushing, Long Island. The appearance was very brilliant, but not essentially different from what has been above described.

23. *Albany.* Brilliant Aurora with converging beams; dense white at the apex. Seen brilliant at *St. Lawrence* and *Bridgewater*.

Utica. Remarkable for its great extent east and west, and for its steady, strong light, which continued till late at night. At 12, slightly columnar in N.

24. *Bridgewater.* At 11, in N. W. N. and N. E., rising in waving lines; sometimes, especially in the east, reaching the zenith.

MAY 7. *Utica.* At 11.30 P. M.

8. *Kingston.* Very brilliant from 8.30 to 10.30.

Utica. Very brilliant, with a well defined arc, at 9.15 P. M.

19. *Albany.* Brilliant. *St. Lawrence.* Brilliant.

Utica. Seen before twilight was gone, in N., and reaching a few degrees E. of N. Deep crimson above; the central and lower parts diversified with different colors of fainter and deeper shades, in which crimson and reddish were predominant. It much resembled a distant fire. At a few minutes before 8, beams shot up in N. W. and a few degrees further W. Evening very clear.

JUNE 5. *Albany.* At 11.30, shooting up into beautiful columns.

JUNE 8 and 9. *Albany.* Several beams.

JULY 31. *Albany.* Brilliant arc and streams.

Onondaga. In luminous spots.

AUGUST 1. *Utica.* Beautifully prismatic and columnar.

2. *Auburn.* At 9 P. M., not brilliant.

Albany. With a brilliant arc.

Onondaga. Beams to N. W., nearly to the zenith.

Utica. Remarkable; at first columnar, with distinct prismatic rays. At 10.30, a broad, well defined arc across the heavens, a little south of the zenith. More complete and perfect than any which had been observed for several years.

11. *Onondaga.* Luminous behind clouds.

Utica. Very bright, not columnar.

12. *Newburgh.* Splendid. At *Onondaga* not luminous.

19. *Onondaga* and *Utica.* Rainbow-form, arc low and spreading.

SEPTEMBER 15. *Auburn.* Not brilliant, at 10 P. M. At *Kinderhook* beautiful. At *Albany* with streamers.

OCTOBER 23. *Onondaga.* A luminous appearance in the N. E., of a yellowish, reddish iron rust color, shooting up towards the zenith, said to have been seen.

NOVEMBER 1. *Utica.* Bright, at 11 P. M., columnar and prismatic.

1837.

JANUARY 14. *Onondaga.* Aurora seen passing in parallel belts from N. E. to S. W., the extremities converging. Thermometer —9.

25. *Bridgewater.* Brilliant. At *Albany* red; first noticed about 6 o'clock P. M., in a broad, red colored arc, from E. to N. W. Barometer rising and at that time 30.12, with the thermometer 14½ and falling. Brightness variable, stronger to W. Sky clear, except a narrow cloud on the eastern horizon. Soon after 7 o'clock, beams shot up from different points, which, at half-past 7, formed a complete corona, a little N. and E. of the Pleiades, probably in the direction indicated by the dipping needle. Whole heavens covered with the Aurora, in many places colored. Jupiter and his moon seen by a telescope through the auroral light. Brightness variable, fading almost away and again flashing up with increased splendor. Brightest at 10.30. The moon shone brightly during the evening.

Delaware. Splendid. The light appeared shortly after sunset, in N. W., and at 8 o'clock red rays shot across to the S. E., forming a complete arc. At 10.30 a corona of red light. At 11 this disappeared, but in half an hour returned still more splendid; at 12 it again disappeared and did not again appear. At *Erasmus Hall* and *Ithaca* the clouds were quite thick, yet the light was very bright, and appeared like the reflection of fire.

New-York. There appeared, soon after twilight, a sombre cloud, the segment of a circle in the north, from which, at 6.30, issued white and red streams. Columns of deep pink, or rose color, from N. W. to E., for nearly an hour, spanned the heavens with a broad belt of light. Beneath this, in the N., were innumerable streams of white and pink rays, having a vertical motion, and joining the crimson arc, presenting a peculiarly brilliant and magnificent appearance. This declined, but at 10 o'clock a corona formed in the zenith, from which rays shot in every direction, occupying nearly the whole heavens. It contracted itself on the N. W. side, and entirely disappeared towards the south.

Buffalo. At fifteen minutes before 7, the heavens lighted up with a red illumination, like the reflection of a fire upon the clouds. The light of unequal strength in different parts of the heavens. Sky at this time obscured by a dense haze. At 7.20 the strongest light having till then prevailed between south and west, and between the horizon and 45° above it, the horizon at due south and from this point to 60° W. suddenly lighted up with increased brightness, and this extending through the zenith soon reached the horizon in the northeast, where its brightness was equal to that in the west but its breadth one or two degrees less. The breadth and brightness in zenith was less, and soon faded, while near the horizon it remained longer. At 9.10 the whole had disappeared, no stars or planets

being visible from the haze. At *Fredonia* the light reappeared, late in the night, very brilliantly.

Mount Pleasant. Splendid. A dark segment, shooting up streams of light from its margin; a corona formed about 10° south of the zenith, from which reddish beams diverged towards the south; a pale blue, crossed by reddish rays, surrounded the point of convergence. Variable. At times, the whole heavens covered by a sheet of flame, which changed with great rapidity.

Kinderhook. Brilliant, fantastic and very changeable; arcs, radiations, flashes and lurid banks; colors various. At *Lansingburgh* and *Lowville*, splendid; reappearing several times during the night. Red appearance of the atmosphere, *Middlebury*, *Monroe*, *Newburgh*.

Cazenovia. At 7 P. M., something resembling luminous clouds appeared, floating from west to east, shedding a light like that of an extensive fire. Continued some time. At 9 P. M. cloudy.

Onondaga. Splendid red arc from E. and W. to the zenith. Variable. At times very bright red, in spots or streaks; sky covered with thin, light clouds; At 12 P. M., it extended across the heavens N. and S., in a long, luminous wave or belt.

Pompey. Cloudy; but an Aurora suspected from the red, luminous appearance.

Redhook. Very splendid. Commenced in N. W., and continued to expand till the whole heavens except the S. and S. W. were covered with streams of light and red, flickering and shooting upwards in various forms towards the zenith. It lasted two hours.

Mexico. A lurid cloud in north, from the highest part of which radiations shot up towards the magnetic zenith, about 5° N. W. of the Pleiades; wind changed from N. to S., and the adjacent houses appeared to be on fire from the flood of red light. The magnetic needle appeared troubled, and attracted towards the west; alternate radiations of white and red light. At 9 o'clock it disappeared.

Rochester. A splendid crimson Aurora, from 7 P. M. till 10.

Schenectady. A splendid red arc, from east to west.

Union Hall. An extraordinary appearance of light in the north, commencing at half-past 6, and increasing till the whole northern heavens glowed with auroral light; in columns converging in the zenith. This appearance continued till late.

Utica. Splendid.

FEBRUARY 17. *Schenectady.* A bright red Aurora.

MARCH 30. *Onondaga.* Rather luminous and uniform, shooting up in light, evanescent streaks or rays, all of which arose perpendicularly to the horizon and converged towards the zenith.

Rochester. A bright auroral arc with streams.

APRIL 5. *Auburn.* Between 9 and 10 P. M.

6. *Albany.* With red beams. At *Cazenovia*, brilliant.

Onondaga. At 6, a splendid auroral cloud just above the setting sun; luminous, wavy, streaked. At 9 P. M., an Aurora.

21. *Delaware.* Extending near the zenith, 8. 30 P. M.

JUNE 2. *Albany.* An arc. As it was going off, small clouds of light were seen rapidly scudding in columns from the east, and on arriving at the zenith, passing circuitously towards the northwest.

JULY 1. *Canajoharie.* Beautiful from 10 to 11 P. M.

Albany, *Cortland* and *Fredonia.* Brilliant, with a corona.

Ithaca, *Kinderhook* and *Kingston.* Very brilliant between 11 P. M.

Lowville. Arching the whole heavens.

Cazenovia. Bright at half-past 10, diffusing itself like luminous clouds in every direction, from the north almost to the extreme south; flashes, somewhat like lightning, darting through these, with distinct vibratory motions which could almost be counted. These oscillations continued over the same space, converging to a point a little south or southeast of the zenith. This radiant light soon filled every part except the southern quarter, and so continued with some variation for about an hour; the light generally white, with some streaks of red.

Onondaga. Splendid luminous columns in the east; at half-past 10, columns from every part met in the zenith, sometimes arched; some fiery red. Thermometer fell 5° in an hour.

Pompey. At 9 P. M. splendid. Streams in every part, converging to a point in the zenith.

Rochester. Very splendid, from 10 to 11. Red, purple and white.

31. *Onondaga.* Slender columns in the northwest.

SEPTEMBER 5. *Onondaga.* At half-past 10, shooting up in tall columns.

OCTOBER 22. *Gaines.* Very brilliant in the evening; heavy fog and banks of clouds on the horizon in the morning.

NOVEMBER 12. *North Salem.* Beams of red light in N. N. W. at 8 P. M.

13. *Gaines.* The clouds tinged with a red blood-like hue.

Schenectady. Splendid red.

14. *Bridgewater.* From N. W. to N. E. very bright and of a reddish cast; corona.

Canajoharie. Very beautiful, covering at times the whole horizon.

Erasmus Hall. Red rays shot up to the zenith.

Fairfield. Very bright; at 9, streaks of red or yellowish light were rising from all directions towards a point about 8° S. of zenith, through which a heavy arc of red light extended in a N. W. and S. E. direction. Towards the S. S. E. and N. of the zenith, dense streaks of light yellow were seen in constant motion. Wind strong in the direction of the arc, and the thermometer at 19°, having fallen 6° in three hours.

Gouverneur. Brilliant; of a deep red color, extending from the zenith, east and west, nearly to the horizon.

Hamilton. Brilliant.

Hartwick. Splendid, about a quarter past 9 P. M.; corona a little south of zenith; white, and around the apparent focus of streams, crimson. It continued half an hour.

Ithaca. Beautiful; commencing in the N. W. about 6 P. M.; sky covered with light clouds, bright red, and gradually spread until the whole heavens were covered, and appeared to fade with the rising of the moon; but between 9 and 10, it broke forth with greater beauty.

Buffalo. A space 15° in diameter, west of Cassiopea and Andromeda and north of Perseus, lit up with a rosy hue of deep intensity early in the evening; from its centre, pencils of white radiated on every side; soon the whole became red, which quickly extended through the zenith and down to the horizon 60° W. of N. It did not extend to the east. During this time, a space in the north remained clear. When the arc disappeared, red streams, mingled with white, arose from either side of the north; these arose and faded without converging. These fading, others further east appeared, moving slowly eastward, not disappearing till near the east point. At 5. 43, the north hazy, and this rapidly thickened for some minutes; at 5. 47, clouds more dense and dark, though still in detached masses, particularly in that space occupied by the red arc, where, west of the zenith, and along the track of the arc, a vivid red appeared along their southern border; while east of the zenith down to the horizon, similar clouds were illuminated on their northern borders. At 5. 51, the red edgings of the clouds disappeared and the N. E. became lighted up with a deep red, but not to the horizon. Soon after the moon arose the Aurora disappeared. No disturbance of the magnetic needle was noticed. One meteor seen.

Lowville. Columns of white and red light shot up with gentle undulations, concentrating at the zenith, spreading a lurid glare. From 6 to 7 and 9 to 10.

Mount Pleasant. Bright, with red streaks reaching to the zenith.

Cazenovia. Brilliant, with radiations to the zenith. It subsided after about an hour, and reappeared at 9, more imposing than at first, like a splendid pavilion, distinctly striped with red and yellow all about the zenith, and extending generally half way down to the horizon.

Onondaga. Began early in W. N. W. and extended in a bright belt to the east. It soon expanded over towards the north, forming a kind of arc across the northern sky, with rays of light and red shooting down towards the horizon. It faded in the west, and grew lighter in the east; the evening somewhat cloudy, and the clouds, even down to the southern horizon, tinged deeply with red; disappeared in an hour.

Pompey. Very brilliant, much resembling that of July 1, with stronger light and more brilliant colors.

Rochester. Crimson Aurora at sunset; rose in the east, and extended to the zenith.

St. Lawrence. Exceedingly beautiful, more so than any previously noticed at that place. Colors silvery, every shade of red and brilliant purple. Whole heavens illuminated, even to the farthest south. At 8 o'clock it appeared in the greatest splendor, when tall columns of silvery light were seen in the northern horizon, sometimes shooting up to the zenith, and again moving slowly from E. to W., as if impelled by a gentle breeze. A bow of the brightest red spanned the heavens, bearing a little N. of W. through the zenith, at which point was a ring of bright silvery light. The whole southern heavens were at the time illuminated with a dark red light, as if reflecting the flames of a conflagration. The whole presented a scene of awful and imposing grandeur. Seen also very splendid at *Utica* and *Union Hall*.

1838.

JANUARY 25. *Cayuga.* An Aurora extending spirally from horizon to zenith.

FEBRUARY 20. *Ithaca.* Brilliant.

21. Brilliant at *Albany*.

Newburgh. Remarkably waving. At *Salem* brilliant motion from W. to E., needle agitated during it, but inclined upon the whole

about $3\frac{1}{2}^{\circ}$ E. The barometer rose and fell alternately, but eventually sunk 0.3 of an inch. The next morning it was at the point marked at 5 o'clock previous to the Aurora. From 7 to 9, the thermometer fell 15° .

APRIL 29. *Kinderhook*. Beautiful between 8 and 11 P. M. Brilliant at *Union Hall*.

JUNE 25. Arc at *Albany*.

JULY 15. With beams at *Albany*.

27. Arc, *Albany*. Brilliant at *Utica*.

AUGUST 22. *Gouverneur*. About 9 P. M. presenting the phenomenon of a beautiful arc, spanning 90° of the horizon, and extending at its highest point about one-third of the way to the pole star; sometimes of a dazzling white and uniformly intense from end to end, and at others broken into luminous columns, some of which, springing from the crown of the arc, and diverging as they advanced, threw a veil of softened light over the northern sky. Detached masses of light like clouds.

Mexico. Began about half-past 7 P. M., with a lurid arc, elevated a few degrees, from which shot forth white rays from the convex side.

SEPTEMBER 13. Auroral arc at *Albany*.

Onondaga. From 10 to 10.30 o'clock, in a broad extended arc across the northern sky, rather luminous.

14. *Onondaga*. Splendid at 10 to 11; appearing in stationary masses of light columns, luminous waves, flashing, flickering, appearing, disappearing, etc., etc.

Albany. With beams. White; about 9 P. M. a bright and well defined line of Aurora light was formed from E. to W., through the zenith, and spanning the sky. After 15 minutes it grew irregular and disappeared. Peculiarly tortuous; *Ogdensburg*.

15. *Onondaga*. Began about 7 o'clock; reddish N. E., not remarkable; 10 o'clock became more varied and beautiful. At *Albany* brilliant. At *Franklin, P.*, a bright streak in the east, bearing off S. W. At *Gouverneur* beautiful streams flashing irregularly to the zenith. At *Mexico* splendid. At *Utica* splendid at 9. Rays white. The body of light extended about 40° on the N., and had an elevation of about 20° .

16. *Onondaga*. Early; about 10.15 beautifully arched; soon began to shoot up in tall, slender columns; arc soon became broken up, and the whole northern region of the sky began to blaze up in flashes, most dense in N. W., of a light lambent appearance, extending to and beyond the zenith. Gradually stretched around to the W., and after half an hour died away. A very light arc, resembling a rainbow, extending quite across the heavens, from E. to W., constantly varying in place, width and brightness; *Hamilton*. At *Cortland* very splendid and luminous, the latter part of the night. Very brilliant Auroras for several evenings in succession, especially the 16th. Centre of radiations near zenith, or about the radiant point of the meteors of 1833, and were peculiarly rapid in their vibrations; at one moment shooting up with the appearance of flame, again receding and emitting a pale, unsteady light. Tremulous motion like waves from E. to W.; *Gaines*. Splendid, *Mexico*. At 9 P. M. *Utica*.

17. *Onondaga*. Not remarkable, till a short time before 9, when a belt shot across a little south of the zenith, and about 45° or 50° beyond it, to the west; at first regular, but soon broken and shortly disappeared. At *Cortland*, at half-past 8 P. M., a narrow strip across the sky, E. and W., lasting 20 minutes.

Hartwick. A most brilliant and luminous arc, between 8 and 9, about 1° in width from E. to W. At *Ithaca* beautiful arc from E. to W. At *Utica* unusually brilliant.

SEPTEMBER 19. *Hamilton*. Eastern lights.

OCTOBER 16. *Albany*. Bright.

NOVEMBER 9. *Utica*. Brilliant at 8 P. M.

14. *Albany*. With arc.

25. *Albany*. Bright.

26. *Mount Pleasant*. Brilliant.

DECEMBER 13. *Onondaga* and *Rochester*. Beautiful.

1839.

JANUARY 10. *Gaines*. Commenced at 6 P. M., and continued all the evening; it, for the most part, remained stationary, resembling a number of rainbows, one within another. Occasionally it veered around very far to the east.

Kinderhook. Brilliant arc in the north, about 30° high in centre.

Rochester. Five arcs.

14. *Auburn*. Splendid. At *Gaines*, very similar to the one on the 10th.

Utica. At 7 P. M., a broad belt of white light, increased in brightness till 9. At *Onondaga*, very beautiful.

19. *Kinderhook*. For several hours. Beautiful, in clouds, and shooting up.

FEBRUARY 4. *Lowville*. Auroral arc from 7 to 10 P. M.

MARCH 5. *Fredonia*. Streamers bright.

Cazenovia. Brilliant. At *Onondaga* and *Rochester*, beautiful, shooting up in tall, slender columns.

19. *Fredonia*. Streamers bright.

APRIL 7. *Cortland*. Very white, commencing about 10 P. M.

MAY 5. *Lowville*. Arc with brilliant streams.

Rochester. Brilliant.

JUNE 7. *Franklin, M.*, and *Albany*. Brilliant.

AUGUST 10. *Lewiston*. Brightest about 10 P. M., when the light shot up nearly half way to the zenith in streams, a little to the N. W. Next day gloomy and rainy.

22. *Lowville*. Bright, beautiful streamers at 9 P. M.

28. *Canandaigua*. Rather luminous in the N. W.

Utica. Very brilliant at half-past 8.

SEPTEMBER 3. *Albany*. Splendid; the entire heavens lighted up with long massy rays of a rich silver hue, radiating from the zenith, and forming a dome of magnificent proportions. Deep crimson mass in east and west alternately, which formed a striking contrast with the long lines of white light with which it at times mingled. Continued till late. Light so strong at times as to cast shadows. The northern horizon gleamed with a steady pale lustre.

Cambridge. Brilliant and varied; appeared soon after dark, and at 40 minutes past 8 became very brilliant. More brilliant in the south than north. The radiant point of the corona was about 15° S. E. of *Lyra*. The Aurora was spread out nearly in the form of the sector of a circle of about 150° from a little S. of E. to a little S. of W. At 9.20 red columns appeared in the east of so vivid a hue as to give a reddish tinge to white objects; in the W. and S. W. it appeared of a snowy whiteness. At 9.30, extremely brilliant, and so light as to enable one to read. Motions very rapid, especially in the north; the beams at their lower extremities, of the various tints of the rainbow.

Canandaigua and *Cortland*. Splendid.

Erasmus Hall. Very clear; at 8.30 a canopy with the apex near the zenith, and brilliant radii extending nearly to the horizon in every direction. Purple near the centre. Soon changed to the more common form, the greatest brilliancy being in the north. Aurora in west and southwest.

Fairfield. Unusually brilliant, extending over the whole of the northern sky.

Franklin, M. Very distinct

Franklin, P. Very splendid; from 7 to 9. Points of radiation east and west, from which belts would shoot up and meet in the zenith; corona at times. At times red, but generally white. Light as strong as that of the full moon. Weather rather colder a day or two before, but after the Aurora it was warm and sultry.

Gaines. It commenced soon after dark, and continued with variable intensity till 10. Point of convergence of radiation a little S. W. of the zenith, between *Lyra* and *Aquila*; during some part of the time the light was dark red, like blood, at others, it was like a brilliant flame, and again of a pale yellow; gave as much light as the full moon, and stars of the first and second magnitude were alone visible. Radiations, at times, as brilliant in the S as N. Evening fine. The wind which for some days blew from the N. W. changed very suddenly to the S. E.

Gouverneur. Splendid at 9 P. M.; the whole heavens glowed with brightness. Columns from the north, of white, red tints, rose to the zenith, having a tremulous motion. A corona formed a little south of the zenith.

Ithaca. Very fine, spreading over nearly every part of the heavens, to within 20° of the southern horizon.

Kinderhook. Remarkable, continuing from early till 2 or 3 o'clock.

Kingston. Beams from every part of the horizon except the S. W., which often united at the zenith. In the S. E. and N. W., these were tinged with red; in the N. and N. E. they were white. First observed between 8 and 9 o'clock; at 9.30 most brilliant.

Lansingburgh. Splendid.

Lewiston. About 9 P. M., very bright and splendid; red and white beams from the horizon uniting in the zenith.

Middlebury. Very beautiful about 8 P. M., radiating like a fan, a blank place for the handle, from a point about 10° S. of the zenith over most of the southern sky. Color purplish-red mingled with white. Soon after the radiations became stronger, and presently dying away, an opposite radiation of light took place, as if from the same point, and a counterpart to the former; a general radiation from this point, towards every part of the horizon, pervading most of the heavens. At 8.30 nearly gone.

Lowville. Its approach was indicated at 8 o'clock, by the appearance of certain apparently cirro cumulus clouds, floating over the whole heavens. At the south, a broad and beautiful arc extended

quite across from E. to W., at an elevation of 30°. In the north, at about the same elevation, was an arc, but broken and constantly varying in brightness, from which streams of a yellowish white color shot up to a point a little west of the zenith. At 8.30, masses of the broken arc were driven, by a north wind, past the zenith, and were apparently piled upon the southern arc, until about 9 o'clock, when the northern arc had disappeared and nearly every luminous appearance in the north had ceased. Just then, the auroral clouds in the south flashed up in columns, pointing to the zenith, and with a varying intensity of color. Red columns rose from the southern arc, and suddenly gave place to succeeding changes of yellow and violet. Changes occurred incessantly in the colors, except a belt of red light from east to west, midway between the zenith and the horizon, varying in width from 3° to 5° and remaining unchanged for twenty minutes. The Aurora continued five hours. A meteor from N. W. shot up into the focus of the beams and disappeared.

Montgomery. Brilliant light from N. E., continuing eight hours, equal in brightness to the full moon.

Mount Pleasant. Of every shade from white to red. Focus of rays constantly moving, but mostly a little south of the zenith. A great variety of forms noticed, and successive waves of light moved rapidly in the direction of the columns to the centre of the radiations.

Oneida Institute. At 9 P. M. in great beauty.

Onondaga. Beautiful; at first red in the east, soon spreading over a great part of the heavens; sometimes radiating and columnar. A zone from E. to W., a little south of the zenith. Rays from the north and south reached only a few degrees each way from the point of meeting near the zenith. Colors red and variable. Continued from 8 till after 9 o'clock.

Oxford. Brilliant at 9 P. M.

Redhook. Very splendid, remarkable for its luminous undulations. Point of radiation a little S. E. of the zenith, near the Pleiades.

Mexico. Splendid.

Rochester. White, blue and yellowish, and a part of the time splendid crimson. A dark arc in N., and streams shooting up in great numbers to the zenith. An arc from a little S. of E. to a little N. of W., sometimes a little incomplete towards the zenith, and having, for a considerable time, a bright nucleus or centre, a little south and west of the zenith, towards which the Aurora appeared to ascend from the north and east, and then to extend southward to many degrees below the zenith. No flashing or waving of the light, or merry dancers, noticed.

Springville. Seen rising from every point but the south, and meeting near the zenith.

Union Hall. Brilliant.

Utica. Radiations from the zenith, shooting down to the horizon; color and brightness variable. At one time limited to the northern heavens, and passing gradually from N. to E., and occasionally illuminating the whole heavens. First seen at half-past seven. Streamers at first white and gradually changing to a dusky copper color, and finally into a red cast. At half-past 8 very brilliant. Radiant point a few degrees S. E. of the zenith, and not confined to any one point of the compass, though least vivid in N. E. Streamers, during their whole appearance, continued in motion.

Boston, Mass. This remarkable Aurora was noticed, extending at times over the whole heavens, but chiefly in streams of light from the zenith to the E. and W. Appeared at times like a veil extending across the sky, and rapidly changing in form and hues from deep purple to brilliant white. In the north the least light. It began at about a quarter-past 8, and was most brilliant at about 9 o'clock. During the afternoon previous, a distinct mirage was observed in the harbor.

Lake C. H., Ia. Noticed near the head of Lake Michigan, much as above described. Also at sea, from the steamship Great Western, in latitude 48°, longitude 44°, where its appearance is described as having been unusually splendid. The wind was very strong at the time, and soon after increased to a hard gale. (See Amer. Jour. Sci., 1st series, xxxviii., 146.)

4. *Canandaigua.* Faint Aurora.

6. *Canandaigua.* Faint in the east, at 10 P. M.

14. *Cortland.* White streams from the N. and W., converging to the zenith, from whence they passed off to the S. and E., of a brilliant red.

Ithaca. Arc broad and low.

OCTOBER 1. *Canandaigua.* For one hour at 8 P. M.

10. *Albany.* Brilliant.

22. *Albany.* Bright red.

NOVEMBER 18. *Canandaigua.* Aurora at N. W.

30. *Canandaigua.* From 6 to 7, in the N.

1840.

JANUARY 3. *Gaines.* Very brilliant; continuing nearly all night, bright enough to form shadows.

Montgomery. Very brilliant for about twenty minutes.

Salem. Brilliant conuscations, rapid and vivid.

4. *Mexico.* Beautiful before daylight.

Salem. No conuscations, but a vast body of light concentrated due north, surrounded by thick clouds, and these by a circumference of vivid light; quite 5° across, which reached from east to west.

Onondaga. Of a splendid silver lustre.

31. *St. Lawrence.* Like clouds illuminated by a bright sun; slight furries of snow.

FEBRUARY 7. *Lowville.* With streams. Rain 46 hours after.

MARCH 5. *Fredonia.* Beautiful.

Lowville. Streams and arc; followed by snow in 19 hours.

Onondaga. Very beautiful, a few minutes past 10 P. M.

8. *Gaines.* In the form of an arc, like a rainbow.

25. *Lowville.* Arc; with snow crystals 33 hours after.

APRIL 1. *Onondaga.* Very beautiful; at 3 A. M., shooting up in tall, slender, variable columns tinged with red; in the northwest.

4. *Onondaga.* Very beautiful arc.

5. *Cortland.* Bright at 3 P. M.

20. *Lowville.* Auroral arc at 11 P. M. Rain 34 hours after.

23. *North Salem.* With vertical rays.

24. *Lowville.* Arc at 9 P. M.; with thunder 21 hours after.

MAY 1. *Lowville.* Auroral arc 9 P. M.; rain 18½ hours after.

29. *Cayuga.* Remarkable for its luminous undulations. It began with a bright streak from east to west. At 9 P. M., an arc of light gradually rose from the eastern horizon, and extended through the zenith, nearly to the western horizon; it increased in splendor for about 30 minutes, and then gradually faded, until it nearly vanished after an hour.

Cortland. About half-past 9 P. M., the sky being without a cloud, a streak of light, like a rainbow, but without its columns, was observed to extend from N. W. to S. E., nearly touching both horizons. Compact, when first noticed, with a breadth of one degree. It then shot out flashes like the common Aurora, and then disappeared gradually. There was a cloud in the N. W., from which the Aurora seemed to generate, from which proceeded flashes of lightning, *Erasmus Hall.*

Fairfield. At 9 P. M., a brilliant Aurora, extending over the whole northern sky, shooting up in bright and constantly shifting flashes, towards the zenith. *Franklin, M.* Beautiful.

Lowville. With streamers at 10 P. M.; rain 54 hours after.

Mount Pleasant. Appeared faint till about a quarter-past 9, when a belt of light from east to west a little south of the zenith appeared. Breadth from 1° to 3°, narrowest near the eastern horizon. Brightness variable; position changed a little, and the west part occasionally disappeared. It appeared to be disconnected with the other lights; it lasted about 30 minutes and was a brilliant spectacle.

North Salem. A beautiful arc from S. E. to N. W.

Rochester. Splendid; at 9 P. M., a bright halo of light was spread over much of the north; about 40° high, and from east to west, an arc passing a little south of the zenith, which had a tinge of red and soon vanished; soon the streams or pillars shot up in the northeast, and round to the northwest, but most were about the north, and clouds of light rose to the zenith and beyond it, and the waving of light began, in rapid and quick succession, passing to the zenith, and beyond it, on each side. Focus a little south and west of that point. The Aurora faded away, but after 10 o'clock it returned in all its splendor, the pillars and waves being superb. The clouds, lighted up towards the zenith, would continue luminous for some time. Soon after 11 it disappeared.

Albany. Very bright, with beams.

Onondaga. It commenced flashing and blazing at half-past 10. Seen as far south of the zenith as 10°. The needle varied 1° east during the display.

JUNE 28. *Lowville.* An arc at 10 P. M.

JULY 25. *Onondaga.* Several beautiful auroral or magnetic clouds during the day. Aurora in the evening.

29. *Clinton.* At 9 P. M., directly in the north.

Onondaga. A beautiful auroral arc; soon bright luminous spots appeared, and columns arose; presently changed to two broad, nearly horizontal strips or belts, one of which soon disappeared.

AUGUST 19. *Onondaga.* Arc, intermediate between an auroral cloud and a real Aurora; first seen soon after sunset; just before 9, it became more broken and luminous in the N. and E. of N.; columns soon shot up, and these were succeeded by an arc, having a dark space below. At half-past 9, two arcs appeared, the upper one en-

ture; the western extremity of the lower one wanting. Just before 10, they appeared to run into each other; bright spots appeared in the space below, advancing and enlarging with a uniform motion to the east. At the same time very delicate columns arose suddenly; from these, and from nearly the whole extent of the upper arc at once, but which continued but a few moments. 2 small meteors. Needle not sensibly affected. At 12, an auroral arc distinctly visible in the moonlight.

25. *Onondaga*. Seen at 10 P. M., early in the evening. Soon became cloudy from the north.

28. *Clinton*. At 9 P. M., 48° towards the zenith, covering 90° of the horizon. Highest due north. Appearance like the approach of sunrise. *Lowville*. At 8 P. M.

SEPTEMBER 25. *Onondaga*. At a quarter-past 10 o'clock a singular Aurora. Northern sky hazy; a space below Ursa Major, of variable brightness. Some time after, an arc formed, low and imperfect in the N. W., and another which was brighter reddish, and these changed brightness several times. At 11½ none but a light strip in the north, which varied in brightness several times in a minute.

OCTOBER 20. *Franklin, M.* Beautiful between 6½ and 7½ P. M. *Lowville*. Streamers.

NOVEMBER 20. *Lowville*. Arc.

1841.

FEBRUARY 7. *North Salem*. Whitish masses without streams.

Rochester. Slight. *Montgomery*. Very bright.

8. *North Salem*. In whitish masses without streams.

21. *Onondaga*. Beautiful at 10 P. M.

22. *Cazenovia*. Beautiful.

Springville. An arc, rising from the N. E. Moving rapidly towards the zenith, gradually diffused and fading.

Onondaga. At 7, arched, at first single, afterwards double, soon became broken; large, luminous spots appeared, resembling light thin clouds.

23. *St. Lawrence*. Very brilliant. At *Rochester*, slight.

MARCH 15. *Lowville*. With streamers.

23. *Clinton*. Brilliant at 10 P. M. At *Fredonia*, bright streams.

Lowville. Arc at 9 P. M. At *North Salem*, near the horizon.

Onondaga. Beautifully arched; the western half appearing all in a blaze; then broken; luminous in spots; columnar. Needle not sensibly affected.

APRIL 18. *North Salem*. Without streams.

29. *Lowville*. Streams at half-past 9 P. M.

25. *Lowville*. At half-past 11 P. M.

MAY 8. *Cayuga*. Low in the north.

Lowville. Streams at 9 P. M.

JUNE 11. *North Salem*. Auroral light on the edges of dark clouds in the north.

15. *Lowville*. At 10 P. M. At *St. Lawrence* very brilliant.

JULY 19. *Gaines*. Very bright.

Rochester. A bright cloud of white light on the north, and a broad arc of light nearly across the horizon, and two-thirds of the distance from the horizon to the zenith.

29. *St. Lawrence*. Very brilliant.

AUGUST 4. *Millville*. Very brilliant.

5. *Merico*. In an arc passing entirely across the horizon.

6. *Cambridge*. A splendid arc from east to west, a little north of the zenith, quite over the heavens; from 8 to 8½ P. M., with frequent flashes. It was also seen in the north.

Oxford. Commenced at half-past 8 P. M.

Union Literary Society. A streak from east to west, about two degrees in width.

Albany. Splendid between 8 and 9 P. M.

Onondaga. Arched; columnar. The needle varied during its continuance.

North Salem. Very brilliant; a luminous arc, from 8° to 10° broad, and about 45° high, extended from E. to N. W. over the constellations Lizard, Cephus, Ursa Major and Ursa Minor. At intervals, a wavy motion passed from the east, although the wind was southwest. Stars somewhat dimmed. Two meteors.

Rochester. A fice cloud of Aurora, 30° high under the N., and then a slighter cloud perhaps 10° higher, and another a little higher, with streams of auroral light towards the zenith, nearly at 20 minutes before 9 P. M. At 8½ an irregular cloud of light, like a dense mass of white cotton fibres, drawn out and matted, rose from nearly east towards the zenith; bent a little, curved at 30° elevation; splendid and dense white; passed the zenith and appeared as a zone extending down to the western horizon. A smaller and fainter belt a few degrees north of this. These disappeared at 8.40. Several

streams in the north. The belt was wholly different from any noticed before; it seemed like solid matter.

Salem. The sky clear and calm for 24 hours before and after.

SEPTEMBER 25. *Cayuga*. Very brilliant.

Albany. Splendid in N. W. at 10 P. M.

North Salem. Extensive, but not brilliant on account of the moon.

Onondaga. Very brilliant, blazing forth with astonishing rapidity and beauty. A magnetic disturbance, very extraordinary, observed at Greenwich and Toronto, C. W.

OCTOBER 5. *Hamilton*. Brilliant.

9. *North Salem*. Faint auroral light; low from 7 to 10 P. M. Lightning in the S. E. and S. At *Albany*, with beams.

NOVEMBER 1. *Millville*. Singular and very beautiful in the south-east.

18. *Fredonia*. Very splendid; the horizon in the north was skirted by a long, dark cloud that extended towards the zenith; about 30° from behind which, streams of extraordinary brightness flashed up in quick succession, passing along the whole length of the clouds. These streams were sometimes of very beautiful colors; red, green, purple and white mingled together, and making a very agreeable contrast.

Ithaca. Brilliant. *Kinderhook*. Brilliant at half-past 10 P. M.

Oxford. Brilliant. *Albany*. Splendid, at 11 P. M.

North Salem. A segment of light extending from N. N. E. to N. W. and about 15° high, with streams shooting perpendicularly to the height of 50°.

1842.

APRIL 11. *Albany*. With streamers.

14. *Gouverneur*. Very brilliant. Commenced about 11 P. M., and faded at the approach of day. In the north were brilliant streamers; in the northwest a succession of flashes, very bright and without intermission during the whole time. Between these two points was a portion of unilluminated sky.

North Salem. Beautiful; in the form of a luminous arc.

Onondaga. Towards morning the phenomenon, as it appeared at Albany, was described as terrific and sublime, like an immense conflagration.

15. *Lowville*. With streamers, very brilliant.

Rochester. Very brilliant.

JUNE 4. *Rochester*. A fine arc arose some north of east, a little after 8 P. M., and moved southward, and extended upward, till a little after nine; it then passed the zenith and extended over nearly to the western horizon. It was much like a roll of white cotton fibres well compacted, and was a little bent towards the zenith, and somewhat jagged and irregular; it grew fainter, moved slowly southwards, passed the zenith several degrees, extended down to the horizon, began to move in slow portions and in irregular files to the west, became less distinct; and in forty minutes after 9 it was gone. It was a brilliant white arc at first. At the same time a light was spread over the north, as a bright cloud, and a few pillars shot up a few degrees, and disappeared as the other, but not wholly nor so soon. After 11 the Aurora arose and increased, and was firm. Some streams appeared towards the north, and a flashing of reddish light.

Auburn. Brilliant from 9 to half-past 10.

JULY 2. *Franklin, M.* Bright at 10 P. M.

3. *Franklin, M.* Very light and variable in its appearance; sometimes extending far past the zenith towards the south.

Fredonia. At 9 P. M., streams of light, changing alternately from white to crimson, appeared to rise from the clouds in the north, east and west, centering in the zenith. About three hours after, a violent shower occurred.

AUGUST 5. *Franklin, M.* Very brilliant.

1843.

MARCH 7. *Middlebury*. Brilliant.

APRIL 6. *Albany*. With streams.

15. *Auburn*. Very brilliant.

JUNE 3. *Franklin, M.* Splendid.

22. *Hamilton*. Brilliant.

AUGUST 3. *Albany*. Brilliant auroral arc.

OCTOBER 5. *Hamilton*. Splendid.

1844.

JANUARY 24. *North Salem*. The only time observed during the year; preceded by snow within 24 hours, and followed by three fair days. The barometer fell before, and rose after it. Of 26 Auroras noticed at this station during the last ten years:

10 were preceded and 8 followed by rain or snow within 24 hours.
 13 " 14 " " " 48 "
 14 " 16 " " " 72 "

FEBRUARY 4. *Auburn*. Exceedingly brilliant and beautiful.

APRIL 5. *Albany*. Bright.

OCTOBER 20. *Rochester*. Very brilliant.

NOVEMBER 1. *St. Lawrence*. Brilliant.

DECEMBER 15. *Hamilton*. Very splendid.

23. *New-York*. At 9 P. M.; noticed the only time during the year. The eastern portion was a bright cloud-like appearance parallel to the horizon; the western portion of the "merry dancers."

1845.

JANUARY 8. *Lansingburgh*. Very brilliant.

9. *Kingston*. Brilliant from 6 to 9 P. M.

Onondaga. Brilliant about 8 P. M., in the form of an arc, extending from N. E. to N. W.

FEBRUARY 25. *Albany*. Brilliant, with streamers.

APRIL 13. *Albany*. Brilliant red Aurora, with streams.

NOVEMBER 3. *Rochester*. Splendid at 7 P. M.; from west of north to east.

DECEMBER 3. *Oxford*. A most splendid Aurora, between 7 and 10. In the north, the heavens were brilliantly illuminated. At one time a luminous arc of white light across the heavens, from N. W. to N. E. A great number of streams rising to the zenith and disappearing. For several days after, the wind continued easterly; it snowed daily.

1846.

MARCH 25. *Mount Pleasant*. Brilliant in the N. W.

MAY 30. *Millville*. Brilliant.

AUGUST 6. *Hamilton*. Very brilliant.

SEPTEMBER 1. *New-York*. A broad zone of bright light, with a few streamers.

9. *Oxford*. At 7½ o'clock P. M., about 40° above the horizon; stretching through about 45° in a regular curve.

21. *Perinton*, Monroe Co. Very singular; columnar; one column in the north, like a comet with a blazing tail, pointing upwards.

23. *Albany*. Brilliant.

OCTOBER 2. *Millville*. Brilliant.

8. *New-York*. A zone of white light, not very extensive, at 9 P. M.

15. *Oxford*. In spiral forms; shooting upwards towards the zenith.

19. *Albany*. Bright, at 8 P. M.

New-York. Bright; covering the northern horizon.

NOVEMBER 17. *New-York*. At 10 P. M., a bright band across the northern horizon.

DECEMBER 9. *Dutchess*. Cleared off at sunset; a very fine Aurora; followed in 14 hours by a severe snow storm.

Kinderhook. Banks of light in the north, near the horizon.

Albany. An arc.

New-York. Bright; not much elevated at 10 P. M.

1847.

JANUARY 17. *Lansingburgh*. Brilliant; reaching from west to northeast, and rising to the zenith.

FEBRUARY 21. *Gouverneur*. Splendid.

MARCH 10. *Albany*. Very brilliant; with arc and streams.

Auburn. Very brilliant.

Dutchess. Very remarkable; the clouds in the northern light darted up from behind, and came raying out from the edges. The flashes reached from the zenith and were rapid as lightning, reaching from nearly northeast to northwest. Lasted from 8½ till midnight; nearly light enough to read print.

Fairfield. Brilliant. *Fredonia*. Seen 9m.

Mount Pleasant. Very brilliant.

New-York. At 8 P. M., and until 10, there was a bright zone of light across the northern horizon, with a few flashes upward; near the centre of the zone, the light was quite bright, so strong as to cast shadows.

North Salem. At 9 P. M., a segment of dark sky, resembling a black cloud, and about 10° high in the centre, extended from N. E. to N. W., from which streamers ascended to the height of 20°, with dark spaces intervening; all of which had a slow motion to the eastward. At 9 the segment was light and somewhat higher; the streamers rising occasionally, by a sudden shooting to the height of 60° or more.

Plattsburgh. Splendid.

Woodstock, Vt. The 19th of March was clear and fine; the planet Mercury was very distinct a little after sunset, as it was for three or four evenings. In the bright evening, a broad arc of Aurora extended over the north from which streams and flashes of light rose towards the zenith, and auroral clouds extended 60° south of the zenith, to which the flashes extended. From the east, round to west, was a halo of light; and pillars moving sometimes eastward and then westward, and sometimes rapidly passing each other streaming over the planet Jupiter and south of it, and moving over Orion and Sirius, lasted till about one o'clock next day. Light, white and yellowish, and crimson, with auroral clouds of very dark color.

Rochester. Splendid.

Springville. Very brilliant.

28. *New-York*. At 8 P. M., there were bright flashes of light springing up through the clouds, which were very thin; the moon shining bright at the time.

APRIL 6. *Dutchess*. Aurora Borealis about 9 P. M.; very remarkable; like the arc of the 19th of March; north, a base of light, like solid wall; on this, at regular intervals, columns of light, formed like crystals of ice freezing, or salt forming after solution; about 10 o'clock there shot forth from the west, a stream, like the tail of an enormous comet, the head at the horizon; this was a long space from the upright columns in the north, a large field of blue sky with stars intervening.

7. *Albany*. Brilliant. *Cortland*. Very brilliant.

Erasmus Hall. Splendid Aurora Borealis, observed between 9 and 10 P. M.; the whole northern sky was almost as brilliant as the western at sundown; and brilliant rays shot up almost to the zenith; from the west, apparently following the wake of the sun, an arc spanned the heavens, from N. W. to S. E., reaching almost to the eastern verge of the hemisphere.

Fairfield. Bright and white, with sudden flashes.

Fredonia. Aurora Borealis; 8 P. M., streamers from the N. E., seemed to scatter and fade as they ascended; then followed an arc, apparently about 300 feet high, stretching from east to west, which soon disappeared, and was succeeded by a bright and variegated belt, running northeast in a horizontal line, and terminating in a black cloud at its eastern extremity.

Hamilton. On the evening of the 6th, there was lightning and thunder; the A. M. of the 7th was rainy; the wind, west by north. About sunset it became clear, and before 9 o'clock the sky was brilliantly lighted by the Aurora Borealis; between 9 and 10, fleecy detachments formed themselves into a bright belt, encompassing the entire heavens; the belt seemed to form in the zodiac, a little south of it, and its width varied from 3° to 7°; it passed off in about half an hour, but the northern field was still intensely lighted. Rain with in the next 24 hours.

Kinderhook. Uncommonly beautiful; an arc was seen spanning the heavens from east to west, as perfect as that witnessed in the summer of 1827.

Montgomery. Brilliant; at about 9¼ P. M., a bright luminous cloud, that filled the heavens, rising in the east and extended to the western horizon; this continued for the space of an hour. Breadth about three degrees.

New-York. At 8 P. M., a bright zone of white light was in the north, with many flashes upward; after a short time, a narrow band, about two degrees above the other, spanned the horizon for a few minutes, when both disappeared, nearly; the lower one soon reappeared, and continued sending forth brilliant flashes of light, which moved westwardly. About 10, a splendid arc spanned the heavens about 10° above the other, its ends resting on the horizon, in points, and the middle expanded; the merry dancers passing from one to the other, frequently appearing like fringe, and sometimes like jewels attached to the lower edge of the upper arc; at 12 the upper had disappeared, but the lower was much lighter than before, with its fringe-like points; at 2.45 A. M., it presented a beautiful appearance, a single narrow band of white light, about 10° above the horizon, with rays from each end; at 3.30 A. M. it had lowered, and had only one end fringed; the moon shone bright, during the latter part.

North Salem. Very beautiful; sometimes forming a complete arc through the zenith; light, of a red tinge. Continued till after midnight.

Oxford. Splendid display; at first rays of light shot upwards, and afterwards waves of light made their appearance, and moved towards the zenith, and there seemed to unite; forming a belt extending from the west to the east.

Cazenovia. About 9 P. M., an arc of light, extending east and west across the heavens, south of Leo, and a little above the Cross, coinciding nearly with the equinoctial. The barometer rose during the evening, but fell before 8 next morning.

- MAY 15. *North Salem*. With a few streamers.
 JUNE 12. *Albany*. Bright Aurora.
 JULY 9. *Albany*. Bright Aurora.
 AUGUST 4. *Albany*. Brilliant; two arcs, and one through the zenith.
New-York. A bright Aurora from 8 P. M.; continued into the night, with a steady light.
Rochester. Beautiful.
 SEPTEMBER 16. *Albany*. Bright.
Mexico. Extending in altitude about 45°; ten of which, next the horizon, presented a white appearance; the remainder, very red at 9½ P. M.
New-York. At 9 P. M., a faint light was visible, which increased until 11 P. M.
 20. *New-York*. At 8 P. M., slight arc for a short time.
Albany. Brilliant. *Plattsburgh*. Very brilliant.
 OCTOBER 13. *North Salem*. Slight auroral light; visible on the edge of dark clouds.
 24. *Rochester*. Brilliant, at three this morning.
 NOVEMBER 1. *Albany*. Brilliant.
New-York. At 9 P. M., a bright steady light continued.
North Salem. Partly concealed by clouds; occasional streamers of a white color shot up 50° or 60° from a point a little west of north; and from 8 to 8½, a reddish space was visible in the northwest, about 40° high.
 3. *Lansingburgh*. Brilliant.
 14. *New-York*. At 9 P. M., a small but bright steady light.
 25. *Albany*. Very brilliant; red northern lights.
North Salem. White at first; afterwards reddish, and again white. A few streamers rose to the height of 40° or 45°, having a slow motion westward.
Rochester. Very fine; soon after sunset the whole northern sky glared with a bright crimson light, as reflecting the light of a great and wide-spread conflagration; soon slight streaks of other light began to appear; then yellowish light, and soon pillars of white light, shot up in various places. An arc extended under the pole star, about 15° high, of which the lower part was very luminous; white, with darker above, and white light shooting from above the dark part of the arc; for a little time there were two arcs, with pillars of light shooting from the crown of each. At 9 o'clock the Aurora had chiefly disappeared, but returned again after midnight, and was described by the watchmen as very splendid towards morning.
 26. *New-York*. 8 P. M., a small faint light.
Rochester. Slight Aurora.
 27. *Rochester*. Slight Aurora; followed by snow squalls next day and the day after.
 DECEMBER 7. *Hamilton*. Brilliant.

1848.

- JANUARY 3. *North Salem*. A mass of dark clouds lay a little east of north, from which a singular belt of cloud, 8° or 10° broad, extended to a point just west of south, passing about 20° east of the zenith, when first observed, at 7½ P. M. This belt exhibited a slight radiance on its east side, and the dark cloud in the north, was illuminated on both sides. At 8, the belt had passed off to the east. A faint light remained in the north till after 9.
 6. *Cortland*. Brilliant.
 16. *Lowville*. Splendid.
Mexico. Very brilliant; extending to the zenith at 8 P. M.
North Salem. Streamers; at first from an arc about 10° wide at the centre; afterwards from the horizon, reaching at 45° in height; at first white and then red. Commenced at 7½ and continued about an hour.
 19. *Plattsburgh*. Faint Aurora.
 FEBRUARY 7. *New-York*. 9½ P. M., the clouds passed off after a snow squall, and a bright Aurora appeared just above the horizon, about 3° in height; above that it was quite dark; no stars could be seen through it.
 8. *Hamilton*. Very brilliant.
Plattsburgh. Unusually clear light, with slight Aurora.
New-York. At 8 P. M. a slight blush for an hour or more.
North Salem. About 10 P. M.; whitish light diffused along the edge of a low arc; the highest point of which a little west of north.
Rochester. Splendid.
 15. *New-York*. From 7 to 10 P. M., a steady, though bright light; moon shining.
 18. *Mount Pleasant*. Brilliant.
 21. *Cortland*. Very brilliant in north and northeast.
Hamilton. Very beautiful. *Lowville*. Very grand.
Mount Pleasant. Brilliant.
Plattsburgh. Very brilliant; blood red; converging at the zenith from all quarters. Slight fall of snow in the night.
St. Lawrence. White and bright erimson.
New-York. At 8 P. M., a steady light till after 9, when it became reddish; and about 9½, streaks of white light streamed through the red and then vanished; the portion next the horizon was white all the time; above this, a small dark zone; and above that, stretching across the northern horizon, a beautiful rose and somewhat crimson blush prevailed.
North Salem. White from the horizon, except in the northwest, where there were streams of a red or purplish hue.
 23. *North Salem*. White streamers from the horizon, between 8 and 9 P. M.
 24. *New-York*. At 9 P. M., a slight white light.
 MARCH 17. *Hamilton*. At 5 A. M.
New-York. At 9 P. M., a steady light rising from the horizon; about 10, a bright arc spanned the heavens; the lower portion of the horizon dark, but the stars could be seen through both; about 11, two very bright red portions appeared at the west end of the arc, which continued fifteen or twenty minutes, when a second arc formed below the upper and between them; very bright spots occasionally appeared (like eardrops), but few of the merry dancers; continued until 11.40.
 23. *Lansingburgh*. Brilliant.
 24. *Fredonia*. 8 P. M.
Newburgh. From half-past seven till late at night.
Plattsburgh. Brilliant. *New-York*. At 10 P. M.
 25. *Hamilton*. Beautiful.
 30. *Plattsburgh*. Slight.
 APRIL 1. *New-York*. At 10 P. M., a steady bright light, extending from about 4° above the horizon.
Rochester. A fine Aurora Borealis, consisting of luminous, white pillars, towards the zenith, from an arc of 15° in altitude, at 9 P. M., waxing and waning light; then white pencils in the northeast hanging like a cloud in the sky; gradually passing westward and vanishing west of north; then succeeded a very heavy double white arc of great beauty. In the east of northeast, was a variable luminous mass of Aurora, as if it was the source of all the mass moving westward. This Aurora presented much the same appearance at Woodstock, Vt., the auroral forms extending even south of the zenith.
 2. *North Salem*. Very few streamers.
 5. *Plattsburgh*. Brilliant; blood red; converging to the zenith.
New-York. At 10 P. M., a steady though faint light.
 6. *Lewiston*. Extended on the horizon 180°, and above it 90°. There was a very brilliant exhibition of deep red light, on the eastern and western lines of the Aurora, which, after some time, diminished in the east and increased in the west, where it continued for the space of two hours; until the Aurora expanded, from columns of light and intermediate dark spaces, into one general uniform light.
Newburgh. First noticed at 2 P. M.; it continued until 3 or 4 next morning; base of dark haze; streams of light flowing out at an angle of 45°; a broken pyramid of light reaching nearly to the zenith. Northwest and northeast, the Aurora extends about 160°; northwest, an outer pyramid stood up, of rose colored or peach blossom light. A most remarkable Aurora. *Oxford*. Bright.
New-York. At 8.30 to 12. a white light, with streamers shooting up and moving westward (the light so bright as to cast shadows); the light stretched across the northern horizon, but not extending to the zenith.
North Salem. Very beautiful, varying from white to purple.
Rochester. Splendid.
 15. *Rochester*. Aurora and auroral clouds, in the evening.
 MAY 18. *North Salem*. An arc about 20° high, faint on account of the moonlight.
 JUNE 1. *New-York*. At 9 P. M., a steady bright light; the western part of the heavens covered with clouds, while it was clear in the northeast.
 JULY 3. *New-York*. At 9 to 10 P. M., a very fine exhibition of streamers.
 11. *Oxford*. In the evening brilliant; covering, at times, half the heavens.
Hamilton. Beautiful; lightning without thunder.
North Salem. White streams, reaching nearly or quite to the zenith.
 12. *Mexico*. Brilliant.
 23. *Cortland*. At 7½ P. M., in brilliant streams of light in the east; a little before 10 o'clock, it extended to the northwest, beyond the zenith. Much rain the fore part of the evening, and the wind shifted from southwest to northwest, at 8 o'clock.

AUGUST 14. *Corland*. Brilliant about 20 minutes past 9, for a short time.

21. *Fairfield*. Brilliant.

New-York. Very bright; 9 to 11 P. M.

OCTOBER 8. *New-York*. A slight though steady light at 9 P. M.

10. *New-York*. A bright glow, with occasional streamers, at 9 P. M.

23. *Oxford*. Very brilliant. Rain next day.

Plattsburgh. Brilliant.

New-York. At 8 to 9½ P. M., there were some fine streams shooting up to the zenith; a portion of them rose-colored.

North Salem. With streamers.

25. *New-York*. A steady white light for some time; commencing at 8 P. M., then movable, but no streamers.

NOVEMBER 17. *Ithaca*. Magnificent; highest about 10 P. M.

Lansingburgh. Splendid.

North Salem. White light, without streamers.

Rochester. "Most splendid; from 7 to 9 P. M., of a deep red color, blood-like and terrific to behold; it seemed as if the heavens were in a state of rapid and glowing combustion. There was no streaming of the light, or radiation, and not the common coruscations; but the canopy from the northern horizon to south of the zenith was one glow of red light. No source of the light was apparent, but the sky seemed in a terrific blaze of blood.

"This was a very extensive Aurora, and was seen in Montreal and much of Canada; over New England; in England, Spain, France, Italy, and probably most of Europe. The paper of the 18th of November, at Madrid, described its appearance the night before, in the same terrific language as in our own papers; so also at Rome, in Italy, and at other places. In many places, a sound attended this Aurora, a whizzing noise. Such a sound has often been published, and as often been disbelieved by philosophers. Yet no one can doubt from the abundant testimony in this case, that an uncommon and peculiar sound was noticed by many observers, in different and distant places."

The pillars and streams were distinct, and larger in the latter part of the evening, and rose to the zenith; they were of a different color from the glowing red, and seemed to be *much higher*, or to be behind and *above the red*.

"The Aurora has been placed at very different heights. Is it not true that the *same part* of the Aurora is not seen by different observers? And for this reason: When the same Aurora is seen the same evening at very different latitudes, the more northern observers ought to see the whole sky covered, and the streams to pass beyond the zenith to their southern horizon, if the observers at such distant places see the same part of the Aurora. But is it common in northern latitudes for the Aurora to pass over quite to the southern horizon? With the curvature of the earth, varying as the square of the distance, it will not require but a moderate distance to the southern horizon of any place in a level country. In different places near the same meridian, the Aurora seems to terminate in the zenith, or north of it commonly.

C. DEWEY."

18. *New-York*. At 7½ P. M., a fine appearance till late in the night; the merry dancers were very numerous.

23. *North Salem*. A few white streams.

26. *New-York*. The whole northern hemisphere was lighted up; brightest at the northeast.

27. *New-York*. Slight, at 9 P. M.

DECEMBER 17. *New-York*. A faint white light at 8 P. M.; increased to a pink, with streamers and waves of white light.

North Salem. At 6 P. M., an arc about 20° high, with a few streamers; at first white, and then for a short time red.

23. *New-York*. At 11.45 P. M., bright steady light, which became cloudy about 1 A. M.

26. *North Salem*. A few white streamers ascending from the horizon, about 7 P. M.

27. *Plattsburgh*. Brilliant, of a reddish tinge.

1849.

JANUARY 22. *New-York*. At 10 P. M., not very bright; a steady white light covering the northern portion of the heavens.

30. *New-York*. A steady white light at 9 P. M.

FEBRUARY 19. *New-York*. At 9 P. M., a long band of white light across the northern heavens.

21. *New-York*. At 10 P. M., a slight but steady light.

MARCH 18. *North Salem*. A luminous arc, about 10° or 13° high in the centre, which was somewhat east of north; streamers shot up, sometimes from the edge of the arc, and sometimes from the horizon near it; at first generally white; occasionally a tinge of red. The whole had a slow motion to the west.

New-York. At 9.30 P. M., a band of white light about 10° above the horizon; at the middle, stretching from a little east of north to south of west, at which points it fell below the horizon; surmounted by a very dark zone; stars shone through both. A very slight haze prevailed.

JULY 24. *Farmers' Hall*. Brilliant.

SEPTEMBER 7. *New-York*. At 8 P. M., a steady white light over the whole northern portion of the horizon.

16. *New-York*. At 9 P. M., a bright steady light with a dark zone below.

18. *New-York*. At 8 P. M., a long column of white light, W. of N. about half an hour.

19. *New-York*. At 9 P. M., a steady white light above a dark zone.

20. *New-York*. At 8 P. M. a faint, steady white light.

OCTOBER 4. *New-York*. At 9 P. M., a faint light, but steady.

20. *New-York*. At 9 to 11 P. M., a bright steady light, stretching across the whole northern horizon about 15° in height; the upper edge very distinctly defined; somewhat curved. Stars very distinctly seen through it.

DECEMBER 17. *New-York*. At 10 P. M. a faint light, N. W.

EXPLANATION OF THE PLATES.

PLATE I.

- FIGS. 1 and 2.—Rain gages used in the observations included in this volume; for descriptions of which, see Introduction, page v.
- FIG. 3.—Halo observed at Lowville, March 19, 1829, at 5 P. M. A colored circle of the ordinary size, with arcs of a larger circle, of double the diameter of the former, and also brightly colored, with the red on the side nearer the sun. Above the sun, a convex arc, colored, and of the same distance from the sun as the external lateral arcs. A luminous and broad parabolic curve on the top of the inner circle. A parhelion in the inner circle, on each side of the sun, and of the same altitude.
- FIG. 4.—A double solar halo, observed at Onondaga and Hamilton, May 1, 1838. A similar one was seen at New-York, Jan. 23, 1845, in which the small one was of an orange color, and the outer one white, and very bright. Also at Schenectady; noticed by the editor of this volume, May 25, 1843, at 5 P. M. The inner circle in this instance was faint, but distinct, and the outer one, irised and brightest on the sides. There were also in this case, a parhelion below the sun, in the smaller circle, and one on each side of the sun in the larger one, as shown in the figure.
- FIG. 5.—Halo observed at Cazenovia, on the morning of January 11, 1831. It consisted of two parhelia east of the sun, the external one elongated vertically, and colored. A convex arc above the sun, with the zenith for its centre.
- FIG. 6.—Solar halo, observed at Turin, Lewis county, April 17, 1843. The circle was colored, and the part coinciding with the inverted arc was very bright.
- FIG. 7.—A halo seen at Schenectady, May 2, 1843, at 4 P. M., colored. A faint trace of a parhelion observed on the opposite side of the sun.
- FIG. 8.—An inverted arc above the sun, colored and very bright; seen at Martinsburgh, Lewis county, September 6, 1843, at 7 A. M. It continued several hours, and assumed several varieties of form. A bright arc was soon after seen below the sun, and at a greater distance from it than the one above. It was broad, not well defined, and appeared to have its convex side also towards the sun. At 10 o'clock, these had assumed the appearance shown in FIG. 9, in which both the ellipse and circle were irised, and both were brightest on the eastern side. An arc of *white light*, being a part of a horizontal circle, with the zenith for its centre, crossed the sun and both arcs, forming parhelia, where it crossed the latter. Seen also at York, Me., and Portsmouth, N. H.
- FIG. 10.—A solar halo, observed at Somerville, St. Lawrence county, October 3, 1851. The arcs having their convex sides toward the sun, were parallel with the horizon. These were not all visible at one time, but appeared in the course of two or three hours. Soon followed by rain.
- FIG. 11.—A solar halo, seen at Martinsburgh, April 11, 1844, from 7 A. M. till afternoon. Every part irised; brightest at 10 A. M.; followed by rain in four days.
- FIG. 12.—Seen at Martinsburgh, April 9, 1844, at 1 P. M. The circle around the sun was broad and very bright. That with the zenith for its centre, was a very distinct circle of bright white light, but parhelia were not noticed at the points of intersection. It lasted half an hour, during which, the sky was perfectly azure and serene. At 3½ P. M. the white circle had disappeared, and parhelia of uncommon brilliancy formed on each side of the sun, with long appendages. Followed by haze in an hour, and by rain in two days.
- FIG. 13.—Halo observed at Richland, Oswego county, March 6, 1847, in which *a*, *b*, were parhelia, with appendages, *c* a parabolic colored arc, overlapping the colored circle, and producing a brilliant parhelion, *d*, an arc of great size, indistinct, but perceptible by indirect vision, and colored like the others, with the red side towards the sun, but having its most conspicuous color violet. A beam of white light passed vertically through the sun.

- FIG. 14.—Solar halo, seen at Somerville, St. Lawrence county, May 1, 1849, in which *a*, *b*, are parhelia, with appendages, and *c*, *d*, arcs of white light, parallel with the horizon. A halo very much like this also observed Oct. 2, 1851, at the same place.
- FIG. 15.—Solar halo, seen August 13, 1851. The larger circle was white and horizontal, the others brightly colored. *a*, *b*, were colored arcs, with their red convex sides towards the sun. These arcs were faint but distinctly irised.
- FIG. 16.—A lunar halo, with a horizontal and vertical bar of light crossing the moon's disc, and producing paraselenæ, by their intersection with the circle. Observed at Somerville, New-York, May 22, 1851, between midnight and 1 o'clock, very distinct by indirect vision.
- FIG. 17.—A solar halo observed January 6, 1846. Uncommonly brilliant and colored.
- FIG. 18.—Solar halo seen at Somerville, New-York, November 9, 1851, in which *a* is a brilliant colored arc, of a horizontal circle, above the sun, *b*, *c*, parhelia of unusual brightness, and highly colored, having indistinct prolongations of light of unusual length.
- FIG. 19.—Radiations at sunset. The example figured, was observed July 10, 1842, at Rochester, and similar appearances are frequently noticed in western New-York, especially in summer, and often when there are no visible clouds to cause the unequal distribution of the twilight glow. In this instance, there was a diffused red light all over the west, and diverging lines of yellowish light, and blue spaces, made up the radiations in the figure.
- FIG. 20.—Diagram showing the comparative proportion of clear and cloudy sky, in the several months. The spaces between the vertical lines, represent the months, and those between the horizontal lines, the days of each month. The amount of cloudy sky in the whole state, is indicated by the shaded part, and that of clear sky, by the white portion. There are also drawn on the figure, curves representing the relative amount of clear and cloudy sky at several stations that are noted in the margin.
- FIG. 21.—Diagram representing the comparative depth of rain in the several months. The depth is indicated in the margin in inches. The curve for the whole state, is drawn with a heavy line, that of several of the individual stations, in light lines.

PLATE II.

- FIG. 1.—Figure showing the relative prevalence of winds from the several points, and their resultant for the whole state. This is constructed in the following manner: Assuming that the whole number of days in a month, are to be represented by a line of a given length (in this figure, this length is four inches), the proportional number of days of wind from each of the several points are laid down as stated in the second note to page xi, of the introduction, making a broken line of the given length. The arrow, by its direction, denotes the course of the resultant of the winds, and by its length, the relative amount.
- FIG. 2.—A diagram representing the winds at Utica, drawn in the same manner as the preceding.
- FIG. 3.—A similar diagram, showing the comparative amount of winds at Kinderhook, and like fig. 2, illustrating the influence of valleys, in giving direction to the surface current.
- FIG. 4.—This diagram represents, in a different manner, the relative prevalence of winds, and is formed by setting off from a central point, distances proportionate to the prevalence of winds from the several points.
- FIGS. 5, 6, 7, 8, 9, represent the comparative extent of winds at Albany, Utica, Kinderhook, Potsdam and East Hampton; stations selected with reference to showing the influence of local causes, in giving direction to the winds near the earth's surface.
- FIG. 10, represents by the arrows, the comparative value and direction of resultant of the winds of the whole state, as well as of many individual stations. These lines are drawn on a scale of nine inches, or three-tenths of an inch to a day.

PLATE III.

Diagram exhibiting the comparative range of temperature in the several months and years, as shown by the mean results of all the stations. Each of the spaces between the vertical lines represents half a month, and between the horizontal lines two degrees. The degree of temperature is engraved for every third month, and the fine line drawn upon the curve of each year shows the mean annual curve of the whole state for the entire period.

PLATE IV.

Similar to the last, but more condensed, showing the mean range of temperature of stations observed ten years or more. The mean curve of all the stations is shown at the top and bottom of the plate.

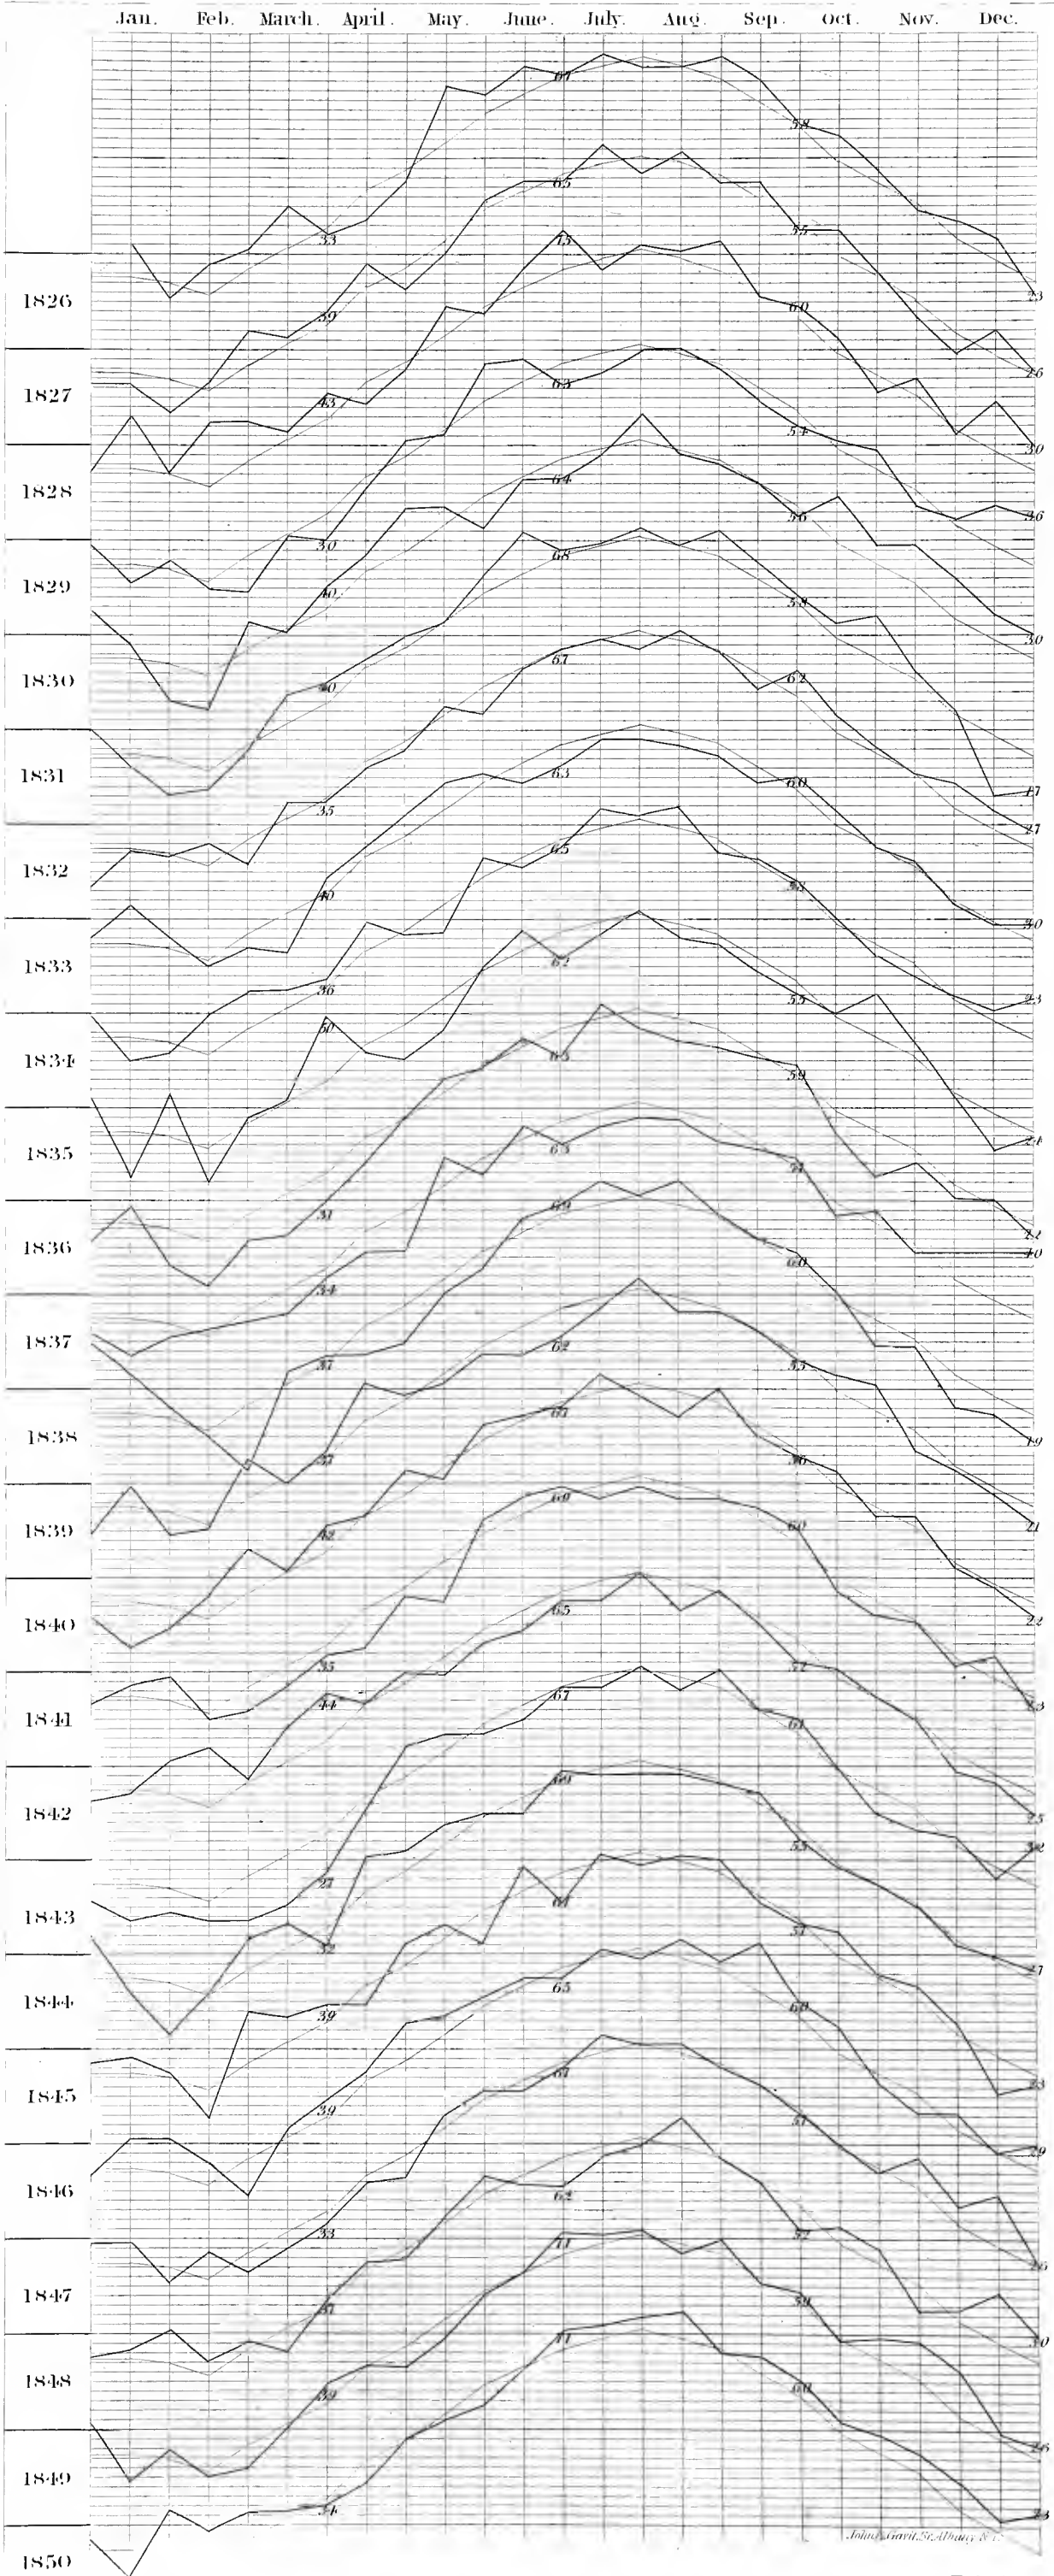

Table showing the comparative range of the thermometer in different years.

Comparative range of Temperature at Different Stations.
